COMMONWEALTH OF MASSACHUSETTS

*DEPARTMENT OF PUBLIC UTILITIES*

**DIRECT TESTIMONY OF**

**Robert B. Hevert**

1 **I. INTRODUCTION**

2 **Q. Please state your name, position, and business address.**

3 A. My name is Robert B. Hevert. I am a Partner at ScottMadden, Inc. (“ScottMadden”).  
4 My business address is 1900 West Park Drive, Suite 250, Westborough, Massachusetts,  
5 01581.

6 **Q. On whose behalf are you submitting this testimony?**

7 A. I am submitting this direct testimony (“Direct Testimony”) before the Massachusetts  
8 Department of Public Utilities (the “Department”) on behalf of NSTAR Electric  
9 Company and Western Massachusetts Electric Company each d/b/a Eversource Energy,  
10 (“Eversource” or the “Company”).

11 **Q. Please describe your educational background.**

12 A. I hold a Bachelor’s degree in Business and Economics from the University of Delaware,  
13 and a Masters of Business Administration with a concentration in Finance from the  
14 University of Massachusetts. I also hold the Chartered Financial Analyst designation.

15 **Q. Please describe your experience in the energy and utility industries.**

16 A. I have worked in regulated industries for over 25 years, having served as an executive  
17 and manager with consulting firms, a financial officer of a publicly traded natural gas

1 utility (at the time, Bay State Gas Company), and an analyst at a telecommunications  
2 utility. In my role as a consultant, I have advised numerous energy and utility clients on  
3 a wide range of financial and economic issues including corporate and asset-based  
4 transactions, asset and enterprise valuation, transaction due diligence, and strategic  
5 matters. As an expert witness, I have provided testimony in more than 150 proceedings  
6 regarding various financial and regulatory matters before numerous state utility  
7 regulatory agencies, including the Department, the Federal Energy Regulatory  
8 Commission, and the Province of Alberta, Canada. A summary of my professional and  
9 educational background, including a list of my testimony in prior proceedings, is included  
10 in Exhibit ES-RBH-2.

11 **II. PURPOSE OF TESTIMONY**

12 **Q. What is the purpose of your testimony?**

13 A. The purpose of my Direct Testimony is to present evidence and provide the Department  
14 with a recommendation regarding the Company's Return on Equity ("ROE"),<sup>1</sup> and to  
15 provide an assessment of the capital structure to be used for ratemaking purposes. My  
16 analyses and conclusions are supported by the data presented in Exhibits ES-RBH-3  
17 through ES-RBH-11, which were prepared by me or under my direction.

---

<sup>1</sup> Throughout my testimony, I interchangeably use the terms "ROE" and "Cost of Equity."

1 **Q. What are your conclusions regarding the appropriate Cost of Equity and capital**  
2 **structure for the Company?**

3 A. My analyses indicate that the Company's Cost of Equity currently is in the range of 10.00  
4 percent to 10.75 percent. Based on the quantitative and qualitative analyses discussed  
5 throughout my Direct Testimony and the Company's risk profile, I conclude that an ROE  
6 of 10.50 percent is reasonable and appropriate. I also conclude that the Company's  
7 proposed capital structure of 53.37 percent common equity, 0.94 percent preferred stock,  
8 and 45.69 percent long-term debt for NSTAR Electric, and 53.34 percent common equity  
9 and 46.66 percent long-term debt for WMECO, is appropriate.

10 Because all financial models are subject to various assumptions and constraints, equity  
11 analysts and investors tend to use multiple methods to develop their return requirements. I  
12 therefore relied on three widely accepted approaches to develop my ROE  
13 recommendation: (1) the Discounted Cash Flow ("DCF") model, including the Constant  
14 Growth, and Multi-Stage forms; (2) the Capital Asset Pricing Model ("CAPM"); and  
15 (3) the Bond Yield Plus Risk Premium approach.

16 In addition to the methods noted above, my recommendation takes into consideration the  
17 Company's rate mechanisms relative to its peers, flotation costs, and the increasing  
18 prevalence of distributed generation ("DG") and long-term contracts on the Company's  
19 risk profile. Although I did not make any explicit adjustments to my ROE estimates for  
20 those factors, I did consider those factors when determining where the Company's Cost  
21 of Equity should be established within the range of results.

1 **Q. How is the remainder of your Direct Testimony organized?**

2 A. The remainder of my Direct Testimony is organized as follows:

- 3 • Section III – Provides a summary of my conclusions and recommendations as  
4 they relate to the Cost of Equity;
- 5 • Section IV – Discusses the regulatory guidelines and financial considerations  
6 pertinent to the development of the cost of capital;
- 7 • Section V – Explains my selection of the proxy group of electric utilities used to  
8 develop my analytical results;
- 9 • Section VI – Explains my analyses and the analytical bases for my ROE  
10 recommendation;
- 11 • Section VII – Provides a discussion of specific business risks that have a direct  
12 bearing on the Company's Cost of Equity;
- 13 • Section VIII – Discusses the current capital market conditions and the effect of  
14 those conditions on the Company's Cost of Equity;
- 15 • Section IX – Addresses the reasonableness of the Company's capital structure;  
16 and
- 17 • Section X – Summarizes my conclusions and recommendations.

18 **III. SUMMARY OF CONCLUSIONS**

19 **Q. What are the key factors considered in your analyses and upon which you base your**  
20 **recommended ROE?**

21 A. My analyses and recommendations considered the following:

- 1           • The *Hope* and *Bluefield* decisions<sup>2</sup> that established the standards for determining  
2           a fair and reasonable allowed Return on Equity, including: consistency of the  
3           allowed return with other businesses having similar risk; adequacy of the return to  
4           provide access to capital and support credit quality; and that the end result must  
5           lead to just and reasonable rates.
- 6           • The effect of the current capital market conditions on investors' return  
7           requirements, including the Company's need to access capital as needed and at  
8           reasonable cost rates.
- 9           • The Company's business risks relative to the proxy group of comparable  
10          companies, and the implications of those risks in arriving at the appropriate ROE.
- 11 **Q.    What are the results of your analyses?**
- 12 A.    The results of my analyses are summarized in Table 1 (below).

---

<sup>2</sup> *Bluefield Waterworks & Improvement Co., v. Public Service Commission of West Virginia*, 262 U.S. 679 (1923); *Federal Power Commission v. Hope Natural Gas Co.*, 320 U.S. 591 (1944).

6

Based on the analytical results presented in Table 1, and in light of the considerations regarding the current capital market environment and the Company's relative business risks discussed throughout the balance of my Direct Testimony, it is my view that a reasonable range of estimates is from 10.00 percent to 10.75 percent, and that an ROE of

1 10.50 percent, is reasonable and appropriate.

2 **IV. REGULATORY GUIDELINES AND FINANCIAL CONSIDERATIONS**

3 **Q. Please provide a brief summary of the guidelines established by the United States**  
4 **Supreme Court (the “Court”) for the purpose of determining the Return on Equity.**

5 A. The Court established the guiding principles for establishing a fair return for capital in  
6 two cases: (1) *Bluefield Water Works and Improvement Co. v. Public Service Comm’n.*  
7 (*“Bluefield”*);<sup>3</sup> and (2) *Federal Power Comm’n v. Hope Natural Gas Co.* (*“Hope”*).<sup>4</sup> In  
8 *Bluefield*, the Court stated:

9 A public utility is entitled to such rates as will permit it to earn a return on  
10 the value of the property which it employs for the convenience of the  
11 public equal to that generally being made at the same time and in the same  
12 general part of the country on investments in other business undertakings  
13 which are attended by corresponding, risks and uncertainties; but it has no  
14 constitutional right to profits such as are realized or anticipated in highly  
15 profitable enterprises or speculative ventures. The return should be  
16 reasonably sufficient to assure confidence in the financial soundness of the  
17 utility and should be adequate, under efficient and economical  
18 management, to maintain and support its credit and enable it to raise the  
19 money necessary for the proper discharge of its public duties.<sup>5</sup>

20 The Court therefore recognized that: (1) a regulated company cannot remain financially  
21 sound unless the return it is allowed to earn on its invested capital is at least equal to the  
22 cost of capital (the principle relating to the demand for capital); and (2) a regulated  
23 company will not be able to attract capital if it does not offer investors an opportunity to

---

<sup>3</sup> *Bluefield Waterworks & Improvement Co., v. Public Service Commission of West Virginia*, 262 U.S. 679, 692-93 (1923).

<sup>4</sup> *Federal Power Commission v. Hope Natural Gas Co.*, 320 U.S. 591, 603 (1944).

<sup>5</sup> *Bluefield*, 262 U.S. at 692-93 (1923).

1 earn a return on their investment equal to the return they expect to earn on other  
2 investments of the same risk (the principle relating to the supply of capital).

3 In *Hope*, the Court reiterated the financial integrity and capital attraction principles of the  
4 *Bluefield* case:

5 From the investor or company point of view it is important that there be  
6 enough revenue not only for operating expenses but also for the capital  
7 costs of the business. These include service on the debt and dividends on  
8 the stock... By that standard the return to the equity owner should be  
9 commensurate with returns on investments in other enterprises having  
10 corresponding risks. That return, moreover, should be sufficient to assure  
11 confidence in the financial integrity of the enterprise, so as to maintain its  
12 credit and to attract capital.<sup>6</sup>

13 In summary, the Court clearly has recognized that the fair Return on Equity should be:  
14 (1) comparable to returns investors expect to earn on other investments of similar risk; (2)  
15 sufficient to assure confidence in the company's financial integrity; and (3) adequate to  
16 maintain and support the company's credit and to attract capital.

17 **Q. Does Massachusetts precedent provide similar guidance?**

18 A. Yes. The Department has consistently stated:

19 The standard for determining the allowed ROE is set forth in *Bluefield* at  
20 692-693 and *Hope* at 603. Specifically, the allowed ROE should preserve  
21 a company's financial integrity, allow a company to attract capital on  
22 reasonable terms, and be comparable to returns on investments of similar

---

<sup>6</sup> *Hope*, 320 U.S. at 603 (1944).

1 risk. See Bluefield at 692-693; Hope at 603, 605. It should be determined  
2 “having regard to all relevant facts.” Bluefield at 692.<sup>7</sup>

3 **Q. Aside from the standards established by the Courts, is it important for a utility to be**  
4 **allowed the opportunity to earn a return that is adequate to attract equity capital at**  
5 **reasonable terms?**

6 A. Yes, it is. A return that is adequate to attract capital at reasonable terms, under varying  
7 market conditions, will enable the subject utility to provide safe, reliable electric  
8 distribution service while maintaining its financial integrity. Although the “capital  
9 attraction” and “financial integrity” standards are important principles in normal  
10 economic conditions, the practical implications of those standards are even more  
11 pronounced as increasing equity market volatility has intensified the importance of  
12 maintaining a strong financial profile.

13 **Q. Are you aware of the Attorney General’s recent request to the Department**  
14 **regarding authorized ROEs in Massachusetts?**

15 A. Yes, I am aware that the Attorney General (“AG”) recently requested that the Department  
16 open an investigation into “ways to increase transparency, efficiency, and public  
17 awareness and confidence regarding the profits that electric and gas companies are  
18 allowed to earn in Massachusetts.”<sup>8</sup> In her request, the AG listed five reasons why she

---

<sup>7</sup> D.P.U. 13-90, *Petition of Fitchburg Gas and Electric Light Company (Electric Division) d/b/a Unitil*, Order, May 30, 2014, at 231. See also, D.P.U. 13-75, *Petition of Bay State Gas Company d/b/a Columbia Gas of Massachusetts*, February 28, 2014, at 327; D.P.U. 11-01, *Petition of Fitchburg Gas and Electric Light Company, d/b/a Unitil*, August 1, 2011, at 420; D.P.U. 09-39, *Petition of Massachusetts Electric Company and Nantucket Electric Company*, November 30, 2009, at 396.

<sup>8</sup> Letter from Massachusetts Attorney General Maura Healey, *RE: Request of the Office of Attorney General, Office of Ratepayer Advocacy for Investigation into Ways to Increase Transparency, Efficiency and Customer Awareness Regarding the Level of Profits Earned by Massachusetts Electric and Gas Distribution Companies*, December 19, 2016.

1 believes authorized ROEs have declined:

- 2 1. The utility industry has been and remains at the lowest level of risk for equity  
3 investment;
- 4 2. Capital costs for utilities, as indicated by long-term bond yields and interest rates  
5 have been and remain at historically low levels;
- 6 3. Although economic conditions have recovered significantly over the past five  
7 years from the Great Recession, the annual growth of the United States economy  
8 remains tepid at 2.00 to 2.50 percent;
- 9 4. The forecast for growth in the United States and World economies is expected to  
10 remain low compared to historical averages; and
- 11 5. Revenue decoupling and cost reconciling rate adjustment mechanisms have  
12 greatly reduced investment risk in utilities.

13 As shown in Chart 1 below, from 2010 to 2016<sup>9</sup> there has been no discernible trend in  
14 authorized ROEs for electric and gas utilities. Rather, as evident in Chart 1, the central  
15 tendency (that is, both the mean and the median) for authorized ROEs during that period  
16 is about 10.00 percent.

---

<sup>9</sup> The years cited in the AG's request.

1

**Chart 1: Authorized Electric and Gas ROEs 2010-2016<sup>10</sup>**

2

3 **Q. What is your response to the AG’s assertion that the utility industry has been and**  
4 **remains at the lowest level of risk for equity investment?**

5 A. I agree that relative to non-regulated industries, the utility industry is less risky. That fact  
6 is captured in the Beta coefficient component of the Capital Asset Pricing Model  
7 (described in Section VI below). As noted in Section VI, utility Beta coefficients are  
8 generally less than one, signifying they are less risky than the market. Companies in  
9 competitive, or non-regulated, industries have the ability to earn returns on common  
10 equity much higher than utilities, whose returns are regulated. Regardless, as the  
11 Supreme Court stated in *Hope*, the authorized ROE should be “commensurate with  
12 returns on investments in other enterprises having corresponding risks” (emphasis

---

<sup>10</sup> Source: SNL Financial.

1 added). That is, the appropriate comparison is to other companies that face similar risks  
2 as utilities. Although investors may require higher returns for non-regulated companies  
3 than they do for utilities, the fact that utilities are less risky than non-regulated companies  
4 has no bearing on the relative risk and required return of a subject utility compared to  
5 other companies of similar risk.

6 Further, that utilities may be less risky than non-regulated companies does not mean that  
7 they are without risk. For example, the utility industry is extremely capital intensive,  
8 requiring significant amounts of external capital to fund large, long-lived projects with  
9 long construction times. Utilities disclose many other risk factors in annual SEC Form  
10 10-Ks including, but not limited to: regulatory risks, geographic and weather risks,  
11 financial risks, operational risks, risks associated with the generation portfolio, and  
12 environmental risks.

13 **Q. Do you believe that the ROEs authorized in Massachusetts are out of step with**  
14 **ROEs authorized elsewhere in the United States?**

15 A. No, I do not. In her request, the AG stated that authorized ROEs across the country have  
16 declined, while in Massachusetts they have increased, implying that returns authorized by  
17 the Department are out of step with the rest of the country. The AG's conclusion,  
18 however, is based on a small sample of data points. First, the AG bases her argument that  
19 returns authorized by the Department have increased since 2011 by comparing authorized  
20 returns to the Department's 9.20 percent ROE authorized for Fitchburg Gas and Electric  
21 ("Fitchburg") in D.P.U. 11-01/11-02. It is important to note, however, that the

1 Department authorized Fitchburg’s ROE at the lower end of the reasonable range “to  
 2 account for Fitchburg’s subpar management performance and customer service.”  
 3 Because the 9.20 percent ROE awarded to Fitchburg reflected the Department’s  
 4 determination of Fitchburg’s poor management performance, it is not an appropriate data  
 5 point upon which to base her comparison. In fact, the 9.20 percent ROE authorized for  
 6 Fitchburg is the lowest ROE ever authorized by the Department.

7 Moreover, the AG’s comparison of ROEs authorized in Massachusetts to those  
 8 authorized in Connecticut is inappropriate, as Connecticut is ranked as one of the least  
 9 constructive regulatory jurisdictions, and routinely authorizes ROEs well below those  
 10 authorized elsewhere in the country.<sup>11</sup> As shown in Table 2 below, ROEs authorized in  
 11 Connecticut have been well below those authorized in the other New England states, as  
 12 well as the rest of the country. ROEs authorized by the Department, on the other hand,  
 13 have been comparable to the other New England states, although somewhat below the  
 14 rest of the country.

15 **Table 2: Authorized Utility ROEs 2008-2016<sup>12</sup>**

	<b>Connecticut</b>	<b>Maine</b>	<b>New Hampshire</b>	<b>Rhode Island</b>	<b>Massachusetts</b>	<b>Vermont</b>	<b>Rest of U.S.</b>

Median	9.18	9.50	9.55	9.65	9.75	10.16	10.05

<sup>11</sup> Regulatory Research Associates.  
<sup>12</sup> Source: SNL Financial.  
<sup>13</sup> Represents Illinois formula rate plans.

1 **Q. Do credit rating agencies consider the regulatory environment in which a utility**  
2 **operates when determining a utility's credit rating?**

3 A. Yes, they do. Standard and Poor's ("S&P"), for example, states that "[o]ne significant  
4 aspect of regulatory risk that influences credit quality is the regulatory environment in the  
5 jurisdictions where a utility operates."<sup>14</sup> S&P explains that "[w]hen we evaluate U.S  
6 utility regulatory environments, we consider financial stability to be of substantial  
7 importance. Cash takes precedence in credit analysis. A regulatory jurisdiction that  
8 recognizes the significance of cash flow in its decision-making is one that will appeal to  
9 creditors."<sup>15</sup>

10 Similarly, Moody's notes that regulators' "actions have a significant impact on the  
11 environment in which a utility operates."<sup>16</sup> Moody's considers the regulatory structure  
12 to be so important that 50.00 percent of the factors that weigh in a ratings determination  
13 are related to the nature of regulation.<sup>17</sup> As noted above, among the factors considered  
14 by Moody's in assessing the regulatory framework are the predictability and consistency  
15 of regulatory actions:

16 As the revenues set by the regulator are a primary component of a utility's  
17 cash flow, the utility's ability to obtain predictable and supportive  
18 treatment within its regulatory framework is one of the most significant  
19 factors in assessing a utility's credit quality. The regulatory framework

---

<sup>14</sup> S&P Global Ratings, RatingsDirect, "Assessing U.S. Investor-Owned Utility Regulatory Environments," August 10, 2016, at 2.

<sup>15</sup> *Ibid.*, at 6.

<sup>16</sup> Moody's Investor Service, *Consistency and Predictability of Regulatory Decisions Drive Differences in US Utility Credit Profiles*, July 21, 2014, at 2.

<sup>17</sup> Moody's Investors Service, *Rating Methodology; Regulated Gas and Electric Utilities* at 6 (Dec. 23, 2013).

1 generally provides more certainty around a utility's cash flow and  
2 typically allows the company to operate with significantly less cushion in  
3 its cash flow metrics than comparably rated companies in other industrial  
4 sectors.

5 \*\*\*

6 In situations where the regulatory framework is less supportive, or is more  
7 contentious, a utility's credit quality can deteriorate rapidly.<sup>18</sup>

8 In my view, a change in Massachusetts' regulatory environment to an environment  
9 similar to Connecticut could negatively affect Massachusetts utilities' credit ratings, and  
10 therefore, raise investors' required Return on Equity.

11 **Q. What is your response to the AG's remaining points regarding the purported**  
12 **downward trend in ROEs?**

13 A. My response to numbers two through five of the AG's points (noted earlier) are  
14 addressed in more detail in the following sections of my Direct Testimony. As discussed  
15 in Section VIII, the recent, and continued low interest rate environment is a direct result  
16 of Federal monetary policy specifically intended to lower interest rates in response to the  
17 financial crisis that began in 2008. As the Federal Reserve has begun its move toward  
18 policy normalization, including the two increases to the Federal Funds rate, interest rates  
19 are expected to increase. To that point, investors currently see only about a 3.50 percent  
20 probability that the Federal Funds rate will **not** be increased over the coming year.<sup>19</sup>

21 As to the effect of rate mechanisms, I discuss in Section VII that estimating the Cost of

---

<sup>18</sup> Moody's Investors Service, Regulatory Frameworks – Ratings and Credit Quality for Investor-Owned Utilities at 2 (June 18, 2010).

<sup>19</sup> <http://www.cmegroup.com/trading/interest-rates/countdown-to-fomc.html>

1 Equity is a comparative assessment. As such, even if it were the case that revenue  
2 stabilization mechanisms mitigate “risk,” they only would affect the Cost of Equity if: (1)  
3 the effect of the mechanism was to reduce risk below the levels faced by the subject  
4 company’s peers in the proxy group; and (2) investors knowingly reduced their return  
5 requirements for the Company as a direct consequence of the mechanisms. Because the  
6 proxy companies all have a revenue stabilization mechanism in some form, in my view,  
7 the Company’s proposed decoupling mechanism would not reduce its Cost of Equity.

8 **V. PROXY GROUP SELECTION**

9 **Q. As a preliminary matter, why is it necessary to select a group of proxy companies to**  
10 **determine the Company’s Cost of Equity?**

11 A. The Cost of Equity for a given enterprise depends on the risks attendant to the business in  
12 which the subject company is engaged. According to financial theory, the value of a  
13 given company is equal to the aggregate market value of its constituent business units.  
14 The value of the individual business units reflects the risks and opportunities inherent in  
15 the business sectors in which those units operate. Because the ROE is a market-based  
16 concept, and in light of the fact that the Company is not a publicly traded entity, it is  
17 necessary to establish a group of companies that are both publicly traded and comparable  
18 to the Company in certain fundamental respects to serve as its “proxy” in the ROE  
19 estimation process.

20 Even if the Company were a publicly traded entity, it is possible that short-term events  
21 could bias its market value in one way or another during a given period. A significant

1 benefit of using a proxy group, therefore, is that it serves to moderate the effects of  
2 anomalous, temporary events that may be associated with any one company.

3 **Q. Does the selection of a proxy group suggest that analytical results will be tightly**  
4 **clustered around average (i.e., mean) results?**

5 A. Not necessarily. The DCF approach is based on the theory that a stock's current price  
6 represents the present value of its future expected cash flows. The DCF model is defined  
7 as the sum of the expected dividend yield and projected long-term growth.  
8 Notwithstanding the care taken to ensure risk comparability, market expectations with  
9 respect to future risks and growth opportunities will vary from company to company.  
10 Therefore, even within a group of similarly situated companies, it is common for  
11 analytical results to reflect a seemingly wide range. At issue, then, is how to select an  
12 ROE estimate from within that range. That determination necessarily must be based on  
13 the informed judgment and experience of the analyst.

14 **Q. Please provide a summary profile of the Company.**

15 A. The Company provides electric distribution service to approximately 1.4 million  
16 residential, commercial, and industrial customers in Massachusetts,<sup>20</sup> and has long-term

---

<sup>20</sup> NSTAR Electric Company, FERC Form 1 Annual Report, December 31, 2015, at 304; Western Massachusetts Electric Company, FERC Form 1 Annual Report, December 31, 2015, at 304.

1 issuer ratings of A (Outlook: Positive), and A2 (Outlook: Stable) from S&P and  
2 Moody's, respectively.<sup>21</sup>

3 **Q. How did you select the companies included in your proxy group?**

4 A. To reflect the Company's electric operations and to obtain more stable analytical results,  
5 I began with the universe of companies that Value Line classifies as Electric Utilities,  
6 which includes 41 domestic U.S. utilities. I then applied the following screening criteria:

- 7 • Because certain of the models used in my analyses assume that earnings and  
8 dividends grow over time, I excluded companies that do not consistently pay  
9 quarterly cash dividends;
- 10 • All of the companies in my proxy group have been covered by at least two utility  
11 industry equity analysts;
- 12 • All of the companies in my proxy group have investment grade senior unsecured  
13 bond and/or corporate credit ratings from S&P;
- 14 • I excluded any company whose regulated operating income over the three most  
15 recently reported fiscal years comprised less than 60.00 percent of the respective  
16 totals for that company;

---

<sup>21</sup> Source: SNL Financial. NSTAR Electric and Western Massachusetts Electric have the same credit ratings from both S&P and Moody's.

- 1           • I excluded any company whose regulated electric operating income over the three  
2           most recently reported fiscal years represented less than 60.00 percent<sup>22</sup> of total  
3           regulated operating income; and
- 4           • I eliminated companies that are currently known to be party to a merger, or other  
5           significant transaction that may affect the stock price and growth rate.

6           Those screening criteria produced the following group of 20 proxy companies:

---

<sup>22</sup> In prior cases before the Department, I excluded companies whose regulated electric operating income over the three most recently reported fiscal years represented less than 90.00 percent of total regulated operating income. Due to recent consolidation in the industry, that threshold would produce a relative small group of proxy companies. As such, in this proceeding I have lowered the threshold to 60.00 percent.

1

**Table 3: Proxy Group**

<b>Company</b>	<b>Ticker</b>
ALLETE, Inc.	ALE
Alliant Energy Corp.	LNT

Portland General Electric Co.	POR
SCANA Corp.	SCG
WEC Energy Group, Inc.	WEC
Xcel Energy, Inc.	XEL

2

3 **Q. Is the approach described above consistent with prior Orders by the Department?**

4 A. Yes, it is. In D.P.U. 10-70, the Department accepted the use of 23 electric companies as  
5 proxies for Western Massachusetts Electric Company.<sup>23</sup> The criteria discussed above are  
6 generally consistent with those used to select the proxy group in that proceeding,  
7 although Western Massachusetts Electric Company included a threshold of 50.00 percent

<sup>23</sup>

D.P.U. 10-70, *Petition of Western Massachusetts Electric Company*, January 31, 2011, at 249.

1 of revenues from electric operations as a selection criterion, whereas my criterion  
2 requires 60.00 percent of regulated operating income from electric operations.

3 **VI. COST OF EQUITY ESTIMATION**

4 **Q. Please briefly discuss the ROE in the context of the regulated rate of return.**

5 A. Regulated utilities primarily use common stock and long-term debt to finance their  
6 permanent property, plant, and equipment. The overall Rate of Return for a regulated  
7 utility is based on its weighted average cost of capital, in which the cost rates of the  
8 individual sources of capital are weighted by their respective book values. Although the  
9 costs of debt and preferred stock can be directly observed, the Cost of Equity is market-  
10 based and, therefore, must be estimated based on observable market information.

11 **Q. How is the required ROE determined?**

12 A. The required ROE is estimated by using one or more analytical techniques that rely on  
13 market-based data to quantify investor expectations regarding required equity returns,  
14 adjusted for certain incremental costs and risks. By their very nature, quantitative models  
15 produce a range of results from which the market required ROE must be selected. As  
16 discussed throughout my Direct Testimony, that selection must be based on a  
17 comprehensive review of relevant data and information, and does not necessarily lend  
18 itself to a strict mathematical solution or formulaic approach. Consequently, the key  
19 consideration in determining the Cost of Equity is to ensure that the methodologies  
20 employed reasonably reflect investors' view of the financial markets in general, and the  
21 subject company (in the context of the proxy group) in particular.

1 Although we cannot directly observe the Cost of Equity, we can observe the methods  
2 frequently used by analysts and investors to arrive at their return requirements and  
3 expectations. While investors and analysts tend to use multiple approaches in developing  
4 their estimate of return requirements, each methodology requires certain judgment with  
5 respect to the reasonableness of assumptions and the validity of proxies in its application.  
6 In essence, analysts and academics understand that ROE models are tools to be used in  
7 the ROE estimation process and that strict adherence to any single approach, or the  
8 specific results of any single approach, can lead to flawed and unreliable conclusions.  
9 That position is consistent with the *Hope* and *Bluefield* finding that it is the analytical  
10 result, as opposed to the methodology, that is controlling in arriving at ROE  
11 determinations. A reasonable ROE estimate therefore considers alternative  
12 methodologies, observable market data, and the reasonableness of empirical results.

13 In my view, it is both prudent and appropriate to use multiple methodologies to mitigate  
14 the risk that the inputs required for a given approach may be less reliable, or that the  
15 underlying assumptions for a given approach may be less applicable, due to changing or  
16 anomalous market conditions. Such use, however, must be tempered with due caution as  
17 to the results generated by each individual approach. As such, I have considered the  
18 results of the Constant Growth and Multi-Stage forms of the DCF model, the Capital  
19 Asset Pricing Model, and the Bond Yield Plus Risk Premium approach.

1           **A.    *Constant Growth Discounted Cash Flow Model***

2   **Q.    Are DCF models widely used in regulatory proceedings?**

3    A.    Yes, in my experience the DCF model is widely recognized in regulatory proceedings.  
 4           Nonetheless, neither the DCF nor any other model should be applied without  
 5           considerable judgment in the selection of data and the interpretation of results.

6   **Q.    Please describe the DCF approach.**

7    A.    The DCF approach is based on the theory that a stock’s current price represents the  
 8           present value of all expected future cash flows. In its simplest form, the DCF model  
 9           expresses the Cost of Equity as the sum of the expected dividend yield and long-term  
 10          growth rate, and is expressed as follows:

11                                       
$$P = \frac{D_1}{(1+k)} + \frac{D_2}{(1+k)^2} + \dots + \frac{D_{\infty}}{(1+k)^{\infty}} \quad [1]$$

12          where  $P$  represents the current stock price,  $D_1 \dots D_{\infty}$  represent expected future dividends,  
 13          and  $k$  is the discount rate, or required ROE. Equation [1] is a standard present value  
 14          calculation that can be simplified and rearranged into the familiar form:

15                                       
$$k = \frac{D_0 (1 + g)}{P} + g \quad [2]$$

16          Equation [2] often is referred to as the “Constant Growth DCF” model, in which the first  
 17          term is the expected dividend yield and the second term is the expected long-term growth  
 18          rate.

1 **Q. What assumptions are required for the Constant Growth DCF model?**

2 A. The Constant Growth DCF model requires the following assumptions: (1) a constant  
3 average growth rate for earnings and dividends; (2) a stable dividend payout ratio; (3) a  
4 constant price-to-earnings (“P/E”) multiple; and (4) a discount rate greater than the  
5 expected growth rate. The model further assumes that the calculated Cost of Equity  
6 applies every year, without change, in perpetuity. The Department has recognized the  
7 limiting nature of those assumptions, pointing out that “[t]his model has a number of very  
8 strict assumptions...” and that those assumptions “...affect the estimates of cost of  
9 equity.”<sup>24</sup> In that regard, the Department’s observations are consistent with the position  
10 noted earlier: considerable judgment should be applied in developing the Constant  
11 Growth DCF analysis, and in interpreting the model’s results.

12 **Q. What market data did you use to calculate the dividend yield component of your**  
13 **DCF model?**

14 A. The dividend yield is based on the current annualized dividend of the proxy companies,  
15 and average closing stock prices over the 30-, 90-, and 180-trading days as of November  
16 30, 2016.

17 **Q. Why did you use three averaging periods to calculate the average stock price?**

18 A. I did so to ensure that the model’s results are not skewed by anomalous events that may  
19 affect stock prices on any given trading day. At the same time, the averaging period

---

<sup>24</sup> D.P.U. 13-90, *Petition of Fitchburg Gas and Electric Light Company (Electric Division) d/b/a Unitil*, May 30, 2014, at 217.

1 should be reasonably representative of expected capital market conditions over the long  
2 term. In prior proceedings, I have used 30-, 90- and 180-day averaging periods. I have  
3 done so in this proceeding, as well. As discussed later in my Direct Testimony, however,  
4 to the extent that the longer averaging conventions reach back to periods during which  
5 utility stocks were valued at unusually high levels, Discounted Cash Flow-based methods  
6 may provide unreasonably low results.

7 **Q. Did you make any adjustments to the dividend yield to account for periodic growth**  
8 **in dividends?**

9 A. Yes, I did. Because utility companies tend to increase their quarterly dividends at  
10 different times throughout the year, it is reasonable to assume that dividend increases will  
11 be evenly distributed over calendar quarters. Given that assumption, it is appropriate to  
12 calculate the expected dividend yield by applying one-half of the long-term growth rate  
13 to the current dividend yield.<sup>25</sup> That adjustment ensures that the expected dividend yield  
14 is, on average, representative of the coming twelve-month period, and does not overstate  
15 the dividends to be paid during that time.

16 **Q. Is it important to select appropriate measures of long-term growth in applying the**  
17 **DCF model?**

18 A. Yes. In its Constant Growth form, the DCF model (*i.e.*, as presented in Equation [2]  
19 above) assumes a single growth estimate in perpetuity. In order to reduce the long-term  
20 growth rate to a single measure, one must assume a constant payout ratio, and that

---

<sup>25</sup> See, Exhibit ES-RBH-3.

1 earnings per share, dividends per share, and book value per share all grow at the same  
2 constant rate. Over the long term, however, dividend growth can only be sustained by  
3 earnings growth. Consequently, it is important to incorporate a variety of measures of  
4 long-term earnings growth into the Constant Growth DCF model.

5 **Q. Please summarize the findings of academic research on the appropriate measure for**  
6 **estimating equity returns using the DCF model.**

7 A. The relationship between various growth rates and stock valuation metrics has been the  
8 subject of much academic research.<sup>26</sup> As noted over 40 years ago by Charles Phillips in

9 The Economics of Regulation:

10 For many years, it was thought that investors bought utility stocks largely  
11 on the basis of dividends. More recently, however, studies indicate that  
12 the market is valuing utility stocks with reference to total per share  
13 earnings, so that the earnings-price ratio has assumed increased emphasis  
14 in rate cases.<sup>27</sup>

15 Philips' conclusion continues to hold true. Subsequent academic research has clearly and  
16 consistently indicated that measures of earnings and cash flow are strongly related to  
17 returns, and that analysts' forecasts of growth are superior to other measures of growth in

---

<sup>26</sup> See, e.g., Harris, Robert, *Using Analysts' Growth Forecasts to Estimate Shareholder Required Rate of Return*, Financial Management, Spring 1986.

<sup>27</sup> Charles F. Phillips, Jr., The Economics of Regulation, Revised Edition, 1969, Richard D. Irwin, Inc., at 285.

1 predicting stock prices.<sup>28</sup> For example, Vander Weide and Carleton state that, “[our]  
2 results...are consistent with the hypothesis that investors use analysts’ forecasts, rather  
3 than historically oriented growth calculations, in making stock buy-and-sell decisions.”<sup>29</sup>  
4 Other research specifically notes the importance of analysts’ growth estimates in  
5 determining the Cost of Equity, and in the valuation of equity securities. Dr. Robert  
6 Harris noted that “a growing body of knowledge shows that analysts’ earnings forecast  
7 are indeed reflected in stock prices.” Citing Cragg and Malkiel, Dr. Harris notes that  
8 those authors “found that the evaluations of companies that analysts make are the sorts of  
9 ones on which market valuation is based.”<sup>30</sup> Similarly, Brigham, Shome and Vinson  
10 noted that “evidence in the current literature indicates that (i) analysts’ forecasts are  
11 superior to forecasts based solely on time series data; and (ii) investors do rely on  
12 analysts’ forecasts.”<sup>31</sup>

13 To that point, the research of Carleton and Vander Weide demonstrates that earnings  
14 growth projections have a statistically significant relationship to stock valuation levels,

---

<sup>28</sup> See, e.g., Christofi, Christofi, Lori and Moliver, *Evaluating Common Stocks Using Value Line’s Projected Cash Flows and Implied Growth Rate*, Journal of Investing (Spring 1999); Harris and Marston, *Estimating Shareholder Risk Premia Using Analysts Growth Forecasts*, Financial Management, 21 (Summer 1992); and Vander Weide and Carleton, *Investor Growth Expectations: Analysts vs. History*, The Journal of Portfolio Management, Spring 1988.

<sup>29</sup> Vander Weide and Carleton, *Investor Growth Expectations: Analysts vs. History*, The Journal of Portfolio Management, Spring 1988.

<sup>30</sup> Robert S. Harris, *Using Analysts’ Growth Forecasts to Estimate Shareholder Required Rate of Return*, Financial Management, Spring 1986.

<sup>31</sup> Eugene F. Brigham, Dilip K. Shome, and Steve R. Vinson, *The Risk Premium Approach to Measuring a Utility’s Cost of Equity*, Financial Management, Spring 1985.

1       whereas dividend growth projections do not. Those findings suggest that investors form  
2       their investment decisions based on expectations of growth in earnings, not dividends.  
3       Consequently, earnings growth not dividend growth is the appropriate estimate for the  
4       purpose of the Constant Growth DCF model.

5       **Q. Please summarize your inputs to the Constant Growth DCF model.**

6       A. I applied the DCF model to the proxy group of electric utility companies using the  
7       following inputs for the price and dividend terms:

- 8               • The average daily closing prices for the 30-trading days, 90-trading days, and  
9               180-trading days ended November 30, 2016 for the term  $P_0$ ; and
- 10              • The annualized dividend per share as of November 30, 2016 for the term  $D_0$ .

11       I then calculated the DCF results using each of the following growth terms:

- 12              • The Zacks consensus long-term earnings growth estimates;
- 13              • The First Call consensus long-term earnings growth estimates; and
- 14              • The Value Line long-term earnings growth estimates.

15       **Q. How did you calculate the high and low DCF results?**

16       A. I calculated the proxy group mean high DCF result using the maximum Earnings Per  
17       Share (“EPS”) growth rate as reported by Value Line, Zacks, and Yahoo! First Call for  
18       each proxy company in combination with the dividend yield for each of the proxy group  
19       companies. The average mean high result then reflects the average maximum DCF result  
20       for the proxy group as a whole. I used a similar approach to calculate the proxy group

1 mean low results, using instead the minimum growth rate as reported by Value Line,  
2 Zacks, and Yahoo! First Call for each proxy company.

3 **Q. What are the results of your DCF analysis?**

4 A. My Constant Growth DCF results are summarized in Table 4 (*see also*, Exhibit ES-RBH-  
5 3).

6 **Table 4: Constant Growth DCF Results**

7

	<i>Mean Low</i>	<i>Mean</i>	<i>Mean High</i>
30-Day Average	8.18%	8.94%	9.69%
90-Day Average	8.13%	8.89%	9.65%
180-Day Average	8.15%	8.91%	9.66%

8

9 **Q. How did you reflect the Constant Growth DCF results in your ROE range and**  
10 **recommendation?**

11 A. I recognize that in D.P.U. 13-90 the Department noted that the assumptions in the  
12 Constant Growth DCF model are “responsible for DCF cost of equity anomalies” and  
13 that because of those limitations “it is appropriate to consider all of the DCF estimates  
14 when evaluating the [c]ompany’s ROE.”<sup>32</sup> I agree with the Department that the  
15 assumptions underlying the Constant Growth DCF model may produce anomalous  
16 results; those results should be viewed with caution, particularly in light of the present  
17 capital market conditions that I discuss below. My recommendation therefore considers

---

<sup>32</sup> D.P.U. 13-90, *Petition of Fitchburg Gas and Electric Light Company (Electric Division) d/b/a Unitil*, May 30, 2014, at 219. [clarification added]

1 the full range of DCF results, along with the range of results from the methods discussed  
2 in the following sections of my Direct Testimony.

3 ***B. Multi-Stage Discounted Cash Flow Model***

4 **Q. What other forms of the DCF model have you used?**

5 A. To address certain limiting assumptions underlying the Constant Growth form of the  
6 DCF model (such as those noted by the Department), I also applied the Multi-Stage  
7 (three-stage) Discounted Cash Flow Model. The Multi-Stage model, which is an  
8 extension of the Constant Growth form and has been applied in regulatory proceedings,  
9 enables the analyst to specify growth rates over three distinct stages. As with the  
10 Constant Growth form of the DCF model, the Multi-Stage form defines the Cost of  
11 Equity as the discount rate that sets the current price equal to the discounted value of  
12 future cash flows. Unlike the Constant Growth form, however, the Multi-Stage model  
13 must be solved in an iterative fashion.

14 **Q. Is the Multi-Stage form of the DCF method commonly considered in regulatory**  
15 **proceedings?**

16 A. Yes, it is. In my experience, forms of the Multi-Stage DCF approach have been  
17 presented and accepted in regulatory proceedings. For example, the Colorado Public  
18 Utilities Commission has found that the Multi-Stage DCF approach is “a rational, model-  
19 based approach supported by the evidence.”<sup>33</sup> In previous rate cases before the

---

<sup>33</sup> Colorado Public Utilities Commission, Proceeding No. 12-AL-1268G, Decision No. R13-1307, at para. 318 and 321.

1 Department, the Multi-Stage DCF method has been presented, and the Department has  
2 noted the appropriateness of considering all of the DCF estimates when evaluating the  
3 Return on Equity.<sup>34</sup>

4 **Q. Please summarize why you have included the Multi-Stage DCF model among those**  
5 **used to estimate the Cost of Equity.**

6 A. First, as noted earlier it is both prudent and appropriate to use multiple methodologies to  
7 mitigate the effects of assumptions and inputs associated with any single approach.  
8 Second, the Constant Growth DCF model assumes that earnings, dividends, and book  
9 value will grow at the same, constant rate in perpetuity; that the payout ratio will remain  
10 constant in perpetuity; and that the Price/Earnings ratio will remain constant in  
11 perpetuity. The model further assumes that the return required today will be the same  
12 return required every year in the future. Those assumptions, however, are not likely to  
13 hold. In particular, it is likely that over time, payout ratios will increase from their  
14 current levels and, to the extent that long-term interest rates increase over the next few  
15 years, it is likely that the Cost of Equity also will increase. In my view, the Multi-Stage  
16 DCF model enables analysts to consider those issues, and to address the limiting and  
17 likely unrealistic assumptions underlying the Constant Growth form of the model.

---

<sup>34</sup> See, e.g., *Petition of Fitchburg Gas and Electric Light Company (Electric Division) d/b/a Unitil*, D.P.U. 13-90, Order, May 30, 2014, at 219.

1 **Q. Please generally describe the structure of your Multi-Stage DCF model.**

2 A. As noted above, the model sets the subject company's stock price equal to the present  
3 value of future cash flows received over three "stages." In the first two stages, "cash  
4 flows" are defined as projected dividends. In the third stage, "cash flows" equal both  
5 dividends and the expected price at which the stock will be sold at the end of the period  
6 (*i.e.*, the "terminal price"). I calculated the terminal price based on the Gordon model,  
7 which defines the price as the expected dividend divided by the difference between the  
8 Cost of Equity (*i.e.*, the discount rate) and the long-term expected growth rate. In  
9 essence, the terminal price is defined by the present value of the remaining "cash flows"  
10 in perpetuity. In each of the three stages, the dividend is the product of the projected EPS  
11 and the expected dividend payout ratio. A summary description of the model is provided  
12 in Table 5 (below).

1

**Table 5: Multi-Stage DCF Structure**

<b>Stage</b>	<b>0</b>	<b>1</b>	<b>2</b>	<b>3</b>
Cash Flow Component	Initial Stock Price	Expected Dividend	Expected Dividend	Expected Dividend + Terminal Value
Inputs	Stock Price; EPS; Dividends Per Share (“DPS”)	Expected EPS; Expected DPS	Expected EPS; Expected DPS	Expected EPS; Expected DPS; Terminal Value
Assumptions	30-, 90-, and 180-day average stock price	EPS Growth Rate; Payout Ratio	Growth Rate Change; Payout Ratio Change	Long-term Growth Rate; Long-term Payout Ratio

2

3 **Q. What are the analytical benefits of your three-stage model?**

4 A. The principal benefits relate to the flexibility provided by the model’s formulation.

5 Because the model provides the ability to specify near-term, intermediate, and long-term

6 growth rates, it avoids the sometimes-limiting assumption that the subject company will

7 grow at the same, constant rate in perpetuity. In addition, by calculating the dividend as

8 the product of earnings and the payout ratio, the model enables analysts to reflect

9 assumptions regarding the timing and extent of changes in the payout ratio to reflect, for

10 example, increases or decreases in expected capital spending, or transition from current

11 payout levels to long-term expected levels. In that regard, because the model is not

1 limited to a single provider, such as Value Line, for all inputs, it mitigates the potential  
2 bias associated with relying on a single source of growth rate projections.<sup>35</sup>

3 The Multi-Stage model also enables the analyst to assess the reasonableness of the inputs  
4 and results by reference to certain market-based metrics. For example, the terminal stock  
5 price can be divided by the expected earnings per share in the terminal year to calculate  
6 the expected P/E ratio. Similarly, the terminal P/E ratio can be divided by the terminal  
7 growth rate to develop a Price to Earnings Growth (“PEG”) ratio. To the extent that the  
8 projected P/E or PEG ratios are inconsistent with historical experience, it may indicate  
9 incorrect or inconsistent assumptions within the balance of the model.

10 **Q. Please summarize your inputs to the Multi-Stage DCF model.**

11 A. I applied the Multi-Stage model to the proxy group described earlier in my Direct  
12 Testimony. My assumptions with respect to the various model inputs are described in  
13 Table 6 (below).

---

<sup>35</sup> See, e.g., Harris and Marston, *Estimating Shareholder Risk Premia Using Analysts’ Growth Forecasts*, *Financial Management*, 21 (Summer 1992).

1

**Table 6: Multi-Stage DCF Model Assumptions**

<b>Stage</b>	<b>Initial</b>	<b>First</b>	<b>Transition</b>	<b>Terminal</b>
Stock Price	30-, 90-, and 180-day average stock price as of November 30, 2016			
Earnings Growth	2015 actual EPS escalated by Period 1 growth rate	EPS growth as average of: (1) Value Line; (2) Zacks; (3) First Call	Transition to Long-term GDP growth	Long-term GDP growth
Payout Ratio		Value Line company-specific	Transition to long-term industry payout ratio	Long-term expected payout ratio
Terminal Value				Expected dividend in final year divided by solved Cost of Equity less long-term growth rate

2

3 **Q. How did you calculate the long-term GDP growth rate?**

4 A. The long-term growth rate of 5.36 percent is based on the real Gross Domestic Product  
5 (“GDP”) growth rate of 3.24 percent, and an inflation rate of 2.05 percent. The real GDP  
6 growth equals the compound annual rate of growth in the chain-weighted real GDP from

1 1929 through 2015.<sup>36</sup> The rate of inflation of 2.05 percent is an average of two  
2 components: the compound annual forward rate starting in ten years (i.e., 2026, which is  
3 the beginning of the terminal period) based on the 180-day average spread between yields  
4 on long-term nominal Treasury Securities and long-term Treasury Inflation Protected  
5 Securities, known as the “TIPS spread” of 1.80 percent; and the projected Blue Chip  
6 Financial Forecast of CPI for 2023 – 2027 of 2.30 percent. I averaged these two  
7 measures of inflation because nominal Treasury yields are related to inflation, and given  
8 the effect of commodities (such as oil) on inflation, the current TIPS spread may  
9 somewhat understate long-term expected inflation.

10 **Q. What were your specific assumptions with respect to the payout ratio?**

11 A. As noted in Table 6, for the first two periods I relied on the first year and long-term  
12 projected payout ratios reported by Value Line<sup>37</sup> for each of the proxy group companies.  
13 I then assumed that by the end of the second period (*i.e.*, the end of year 10), the payout  
14 ratio will converge to the long-term industry average of 66.88 percent.<sup>38</sup>

15 **Q. What was your principal assumption regarding the terminal value?**

16 A. Although I performed a series of analyses in which the terminal value is calculated based

---

<sup>36</sup> Bureau of Economic Analysis, November 29, 2016 update.

<sup>37</sup> As reported in the Value Line Investment Survey as “All Div’ds to Net Prof.”

<sup>38</sup> Source: Bloomberg Professional. The assumption of mean reversion in payout ratios is consistent with published texts. As noted by Morin, “Most firms, including utilities, tend to maintain a fixed payout ratio when it is averaged over several years.” See Roger A. Morin, PhD, New Regulatory Finance, Public Utilities Reports, June 2006, at 258.

1 on the terminal growth rate described above,<sup>39</sup> I also performed a series of analyses in  
2 which the terminal value is based on the current P/E ratio.<sup>40</sup> The results of those  
3 analyses are shown in Table 7 below (*see also*, Exhibit ES-RBH-4, pages 11-19).

4 **Table 7: Multi-Stage DCF Results**

	<i>Low</i>	<i>Mean</i>	<i>High</i>
30-Day Average	9.77%	10.24%	10.70%
90-Day Average	9.65%	10.11%	10.57%
180-Day Average	9.69%	10.15%	10.61%

5  
6 **Q. Did you undertake any additional analyses to support your DCF model results?**

7 A. Yes. While the Department accepts the DCF models in its analysis, it may also rely on  
8 other approaches to determine the appropriate rate of return. As such, I also applied the  
9 Capital Asset Pricing Model, and the Bond Yield Plus Risk Premium method.

10 ***C. Capital Asset Pricing Model Analysis***

11 **Q. Please briefly describe the general form of the CAPM analysis.**

12 A. The CAPM analysis is a risk premium approach that estimates the Cost of Equity for a  
13 given security as a function of a risk-free return plus a risk premium (to compensate  
14 investors for the non-diversifiable or “systematic” risk of that security). As shown in

---

<sup>39</sup> See, Exhibit ES-RBH-4, pages 1-9.

<sup>40</sup> Defined as the 30-day average of the proxy group P/E ratio, calculated as an Index. In D.P.U. 15-155, the Attorney General argued that utilities’ relatively high P/E ratios are “justified.” See, Testimony and Exhibits of J. Randall Woolridge, Ph.D., D.P.U. 15-155, at 70.

1 Equation [3], the CAPM is defined by four components, each of which theoretically must  
2 be a forward-looking estimate:

3 
$$k = r_f + \beta(r_m - r_f) \quad [3]$$

4 where:

5  $k$  = the required market ROE;

6  $\beta$  = Beta coefficient of an individual security;

7  $r_f$  = the risk-free rate of return; and

8  $r_m$  = the required return on the market as a whole.

9 In Equation [3], the term  $(r_m - r_f)$  represents the Market Risk Premium. According to the  
10 theory underlying the CAPM, since unsystematic risk can be diversified away by adding  
11 securities to their investment portfolios, investors should be concerned only with  
12 systematic or non-diversifiable risk. Non-diversifiable risk is measured by the Beta  
13 coefficient, which is defined as:

14 
$$\beta_j = \frac{\sigma_j}{\sigma_m} \times \rho_{j,m} \quad [4]$$

15 where  $\sigma_j$  is the standard deviation of returns for company “j”;  $\sigma_m$  is the standard deviation  
16 of returns for the broad market (as measured, for example, by the S&P 500 Index); and  
17  $\rho_{j,m}$  is the correlation of returns between company  $j$  and the broad market. Thus, the Beta  
18 coefficient represents both the relative volatility (*i.e.*, the standard deviation) of returns,  
19 and the correlation in returns between the subject company and the overall market.

1 **Q. What assumptions regarding the risk-free rate did you include in your CAPM**  
2 **analysis?**

3 A. Because utility assets represent long-term investments, I used two different estimates of  
4 the risk-free rate: (1) the current 30-day average yield on 30-year Treasury bonds (*i.e.*,  
5 2.75 percent); and (2) the near-term (that is, through the first calendar quarter of 2018)  
6 projected 30-year Treasury yield (*i.e.*, 3.13 percent).<sup>41</sup>

7 **Q. Please describe your *ex-ante* approach to estimating the Market Risk Premium.**

8 A. The approach is based on the market-required return, less the current 30-year Treasury  
9 bond yield. To do so, I relied on data from two sources: (1) Bloomberg; and (2) Value  
10 Line. For both Bloomberg and Value Line, I calculated the market capitalization  
11 weighted expected dividend yield (using the same one-half growth rate assumption  
12 described earlier), and combined that amount with the market capitalization weighted  
13 projected earnings growth rate to arrive at the market capitalization weighted average  
14 DCF result. I then subtracted the current 30-year Treasury yield from that amount to  
15 arrive at the market DCF-derived *ex-ante* Market Risk Premium estimate. The results of  
16 those calculations are provided in Exhibit ES-RBH-5.

17 **Q. How did you apply your expected Market Risk Premium and risk-free rate**  
18 **estimates?**

19 A. I relied on each of the *ex-ante* Market Risk Premia discussed above, together with the  
20 current and projected 30-year Treasury bond yields as inputs to my CAPM analyses.

---

<sup>41</sup> See, Blue Chip Financial Forecasts, Vol. 35, No. 12, December 1, 2016, at 2.

1 **Q. What Beta coefficients did you use in your CAPM analysis?**

2 A. As shown in Exhibit ES-RBH-6, I considered the Beta coefficients reported by two  
3 sources: Bloomberg and Value Line. For each source, I employed the average of the  
4 reported Beta coefficient for each proxy company. While both of those services adjust  
5 their calculated (or “raw”) Beta coefficients to reflect the tendency of the Beta coefficient  
6 to regress to the market mean of 1.00, Value Line calculates the Beta coefficient over a  
7 five-year period, while Bloomberg’s calculation is based on two years of data.

8 **Q. What are the results of your CAPM analyses?**

9 A. The results are summarized in Table 8 ( *see also*, Exhibit ES-RBH-7).

10 **Table 8: Summary of CAPM Results**

11

	<i>Bloomberg Derived Market Risk Premium</i>	<i>Value Line Derived Market Risk Premium</i>
<i>Average Bloomberg Beta Coefficient</i>		
Current 30-Year Treasury (2.75%)	8.90%	9.51%
Near-Term Projected 30-Year Treasury (3.13%)	9.28%	9.89%
<i>Average Value Line Beta Coefficient</i>		
Current 30-Year Treasury (2.75%)	10.19%	10.94%
Near-Term Projected 30-Year Treasury (3.13%)	10.57%	11.32%

12

13 **D. Bond Yield Plus Risk Premium Approach**

14 **Q. Please generally describe the Bond Yield Plus Risk Premium approach.**

15 A. This approach is based on the basic financial tenet that equity investors bear the residual

1 risk associated with ownership and therefore require a premium over the return they  
2 would have earned as a bondholder. That is, since returns to equity holders are more  
3 risky than returns to bondholders, equity investors must be compensated for bearing that  
4 additional risk. Risk premium approaches, therefore, estimate the Cost of Equity as the  
5 sum of the equity risk premium, and the yield on a particular class of bonds. Because the  
6 Equity Risk Premium is not directly observable, it must be estimated using one of several  
7 approaches, some of which incorporate *ex-ante*, or forward-looking estimates of the Cost  
8 of Equity, and others that consider historical, or *ex-post*, estimates. An alternative  
9 approach is to use actual authorized returns for electric utilities to estimate the Equity  
10 Risk Premium.

11 **Q. Please explain how you performed your Bond Yield Plus Risk Premium analysis.**

12 A. As discussed above, I first defined the Risk Premium as the difference between  
13 authorized ROEs and the then-prevailing level of long-term (*i.e.*, 30-year) Treasury yield.  
14 I then gathered data from 1,488 electric utility proceedings between January 1, 1980 and  
15 November 30, 2016.<sup>42</sup> I also calculated the average period between the filing of the case  
16 and the date of the final order (that is, the lag period). To reflect the prevailing level of  
17 interest rates during the pendency of each proceeding, I calculated the average 30-year  
18 Treasury yield over the applicable average lag period (approximately 201 days).

---

<sup>42</sup> Source: Regulatory Research Associates.

1 Because the data covers a number of economic cycles,<sup>43</sup> the analysis also may be used to  
2 assess the stability of the Equity Risk Premium. As noted above, the Equity Risk  
3 Premium is not constant over time; prior research has shown that it is directly related to  
4 expected market volatility, and inversely related to the level of interest rates.<sup>44</sup> That  
5 finding is particularly relevant given the historically low level of current Treasury yields.

6 **Q. How did you model the relationship between interest rates and the Equity Risk**  
7 **Premium?**

8 A. I modeled the relationship using regression analysis, in which the observed Equity Risk  
9 Premium was the dependent variable, and the average 30-year Treasury yield was the  
10 independent variable. Relative to the long-term historical average, the analytical period  
11 includes interest rates and authorized ROEs that are quite high during one period (*i.e.*, the  
12 1980s) and that are quite low during another (*i.e.*, the post-Lehman bankruptcy period).  
13 To account for that variability, I used the semi-log regression equation, in which the  
14 Equity Risk Premium is expressed as a function of the natural log of the 30-year Treasury  
15 yield:

$$RP = \alpha + \beta(\text{LN}(T_{30})) [5]$$

---

<sup>43</sup> See, National Bureau of Economic Research, U.S. Business Cycle Expansion and Contractions.

<sup>44</sup> See, e.g., Robert S. Harris and Felicia C. Marston, *The Market Risk Premium: Expectational Estimates Using Analysts' Forecasts*, Journal of Applied Finance, Vol. 11, No. 1, 2001, at 11-12; Eugene F. Brigham, Dilip K. Shome, and Steve R. Vinson, *The Risk Premium Approach to Measuring a Utility's Cost of Equity*, Financial Management, Spring 1985, at 33-45; and Farris M. Maddox, Donna T. Pippert, and Rodney N. Sullivan, *An Empirical Study of Ex Ante Risk Premiums for the Electric Utility Industry*, Financial Management, Autumn 1995, at 89-95.

1 As shown on Chart 2 (below), semi-log regressions are useful when measuring an  
2 absolute change in the dependent variable (in this case, the Risk Premium) relative to a  
3 proportional change in the independent variable (the 30-year Treasury yield).

4 **Chart 2: Equity Risk Premium<sup>45</sup>**

5  
6 As Chart 2 demonstrates, over time there has been a statistically significant, negative  
7 relationship between the 30-year Treasury yield and the Equity Risk Premium. An  
8 important consequence of that relationship is that simply applying the long-term average  
9 Equity Risk Premium of 4.53 percent (*see* Exhibit ES-RBH-8) to current Treasury yields  
10 would significantly understate the Cost of Equity. Based on the regression coefficients in  
11 Chart 2, however, the implied ROE is between 10.01 percent and 10.34 percent (*see*  
12 Exhibit ES-RBH-8).

---

<sup>45</sup> See also, Exhibit ES-RBH-8.

1 **VII. BUSINESS RISKS AND OTHER CONSIDERATIONS**

2 **Q. What additional information did you consider in assessing the analytical results**  
3 **discussed above?**

4 A. Because the analytical methods discussed above produce a range of estimates, there are  
5 several additional factors that should be taken into consideration when establishing a  
6 reasonable range for the Company's Cost of Equity. Those factors include (1) the  
7 Company's rate mechanisms relative to its peers, (2) flotation costs, and (3) the  
8 increasing prevalence of DG and long-term contracts.

9 **A. Rate Mechanisms**

10 **Q. Please provide an overview of the Department's prior directive regarding rate case**  
11 **proceedings and evidence of the relationship between cost recovery mechanisms and**  
12 **the Cost of Equity.**

13 A. In the Department's Order in D.P.U. 07-50A, *Investigation by the Department of Public*  
14 *Utilities on its own Motion into Rate Structures that will Promote Efficient Deployment of*  
15 *Demand Resources* (the "Decoupling Order"), the Department stated that it "will consider  
16 the impact of a decoupling mechanism for a distribution company along with all other  
17 factors affecting that company's required ROE in the context of a rate proceeding, where  
18 the evidence and arguments may be fully tested."<sup>46</sup> In rate case orders issued since the  
19 Decoupling Order, the Department consistently has stated that it considers each

---

<sup>46</sup> D.P.U. 07-50A, *Investigation by the Department of Public Utilities on its own Motion into Rate Structures that will Promote Efficient Deployment of Demand Resources*, Order, July 16, 2008, at 74.

1 company's reconciling mechanisms when determining the allowed ROE.<sup>47</sup> Consistent  
2 with the Department's directive in the Decoupling Order, in this section I present  
3 evidence regarding the effect of the Company's proposed revenue decoupling  
4 mechanisms on its relative risk (and, therefore, on its Cost of Equity). As discussed  
5 below, my assessment focuses on the prevalence of revenue stabilization mechanisms  
6 among the proxy companies.

7 **Q. Please briefly describe the Company's proposed Revenue Decoupling and**  
8 **Performance Based Rate mechanisms.**

9 A. In this proceeding, the Company is proposing a full revenue decoupling mechanism  
10 ("RDM") for NSTAR Electric that is substantially similar to the mechanism approved by  
11 the Department for WMECO in D.P.U. 10-70, in that actual billed revenue would be  
12 reconciled annually with target revenue set by the Department. The proposed RDM tariff  
13 applies to both WMECO (replacing the current WMECO RDM) and NSTAR Electric.  
14 To recover the distribution revenue target through the RDM, actual revenue is compared  
15 to the distribution target revenue at the end of the year, and the difference is allocated to  
16 each rate class and divided by forecast sales to produce a cent per kWh revenue  
17 decoupling adjustment factor ("RDAF") for each class. The RDAF is applied to  
18 customer's billed kWh during the subsequent year, and can be either a credit or debit,

---

<sup>47</sup> See e.g., D.P.U. 09-39, *Petition of Massachusetts Electric Company and Nantucket Electric Company*, Order, November 30, 2009, at 392; D.P.U. 12-25, *Petition of Bay State Gas Company, d/b/a Columbia Gas of Massachusetts*, Order, November 1, 2012, at 438-439; D.P.U. 13-90, *Petition of Fitchburg Gas and Electric Light Company (Electric Division) d/b/a Unitil*, Order, May 30, 2014, at 234.

1 depending on whether actual revenue is greater than or less than the distribution revenue  
2 target in the prior year.<sup>48</sup>

3 In addition, as described by Witnesses Edward A. Davis and Richard D. Chin, the  
4 Company's annual distribution revenue target would be determined by its proposed  
5 performance-based ratemaking mechanism ("PBRM") for both NSTAR Electric and  
6 WMECO. The PBRM would annually adjust the distribution revenue target approved by  
7 the Department for inflation and other factors. This adjustment would be allocated to  
8 each rate class within NSTAR Electric and WMECO, and the non-customer components  
9 of base rates in each class would be adjusted accordingly. Once base distribution rates  
10 are adjusted through the PBRM, the new revenue target for each entity is reconciled  
11 through the RDM as described above.

12 **Q. How common are revenue stabilization and cost recovery mechanisms within the**  
13 **industry in general?**

14 A. There is little question that revenue stabilization and cost recovery structures have  
15 become increasingly common. The increased interest in such mechanisms has generally  
16 resulted from the growing cost of maintaining system reliability, coupled with flat or  
17 declining sales volume brought on by energy efficiency. Adjustment mechanisms to  
18 recover fuel costs, purchased power expenses, energy efficiency and demand-side  
19 program costs, new plant investment, and other expenses are common.<sup>49</sup> In addition,

---

<sup>48</sup> The Company is proposing to calculate separate RDAFs for NSTAR Electric and WMECO.  
<sup>49</sup> See, Exhibit ES-RBH-10.

1 decoupling mechanisms have been implemented by electric utilities in 25 states.<sup>50</sup>

2 Although the specific form of the Company's proposed mechanisms may be unique, the  
3 adoption and implementation of alternative regulation mechanisms in general is quite  
4 common and has become an increasingly visible issue to investors.

5 **Q. Are cost recovery and revenue stabilization mechanisms common among the proxy**  
6 **companies?**

7 A. Yes, they are. Exhibit ES-RBH-10 provides a summary of revenue stabilization  
8 mechanisms and cost trackers currently in effect at each electric utility subsidiary of the  
9 proxy companies. As Exhibit ES-RBH-10 demonstrates, all of the proxy companies  
10 employ cost recovery mechanisms similar to those in place at the Company. Nearly all of  
11 the proxy companies' operating subsidiaries recover fuel, as well as energy efficiency  
12 costs through a cost recovery mechanism; and 14 of the 20 proxy companies have  
13 mechanisms in place to recover costs of renewable energy projects, such as the  
14 Commonwealth's Renewable Portfolio Standard ("RPS").<sup>51</sup> As to decoupling  
15 mechanisms, ten of the 20 proxy companies have either full or partial decoupling  
16 mechanisms in place in at least one operating subsidiary. Exhibit ES-RBH-10 also  
17 includes a summary of the alternative regulation and incentive plans currently in effect at  
18 the proxy companies, including formula-based rate plans, which provide comprehensive

---

<sup>50</sup> See, e.g., *Adjustment Clauses: A State-by-State Overview*, Regulatory Research Associates Regulatory Focus, August 22, 2016.

<sup>51</sup> As mandated by the Green Communities Act, Acts of 2008, Chapter 169, Section 83 and 83A, as amended by Acts of 2012, Chapter 209.

1 adjustment mechanisms that automatically adjust rates in the event that earned return is  
2 above or below an authorized range.

3 **Q. How have you reflected that information in your assessment of the Company's Cost**  
4 **of Equity?**

5 A. First, my analyses and conclusions recognize that developing the Cost of Equity  
6 necessarily is a comparative assessment. As such, even if it were the case that revenue  
7 stabilization mechanisms mitigate "risk," they only would affect the Cost of Equity if: (1)  
8 the effect of the mechanism was to reduce risk below the levels faced by the subject  
9 company's peers in the proxy group; and (2) investors knowingly reduced their return  
10 requirements for the Company as a direct consequence of the mechanisms. The first  
11 analytical step, therefore, is to understand whether revenue stabilization mechanisms are  
12 in place at the proxy companies.

13 I have addressed the question of the extent to which revenue stabilization mechanisms are  
14 in place at comparable companies in Exhibit ES-RBH-10. There, I note that all of the 20  
15 proxy companies have such mechanisms in place in at least one jurisdiction. Because  
16 revenue stabilization mechanisms are so common among electric distribution utilities,  
17 there is no reason to believe that the Company is less risky than its peers. I therefore do  
18 not believe it would be appropriate to reduce the Company's ROE in connection with its  
19 rate mechanisms, including its proposed decoupling mechanism.

1           ***B. Flotation Costs***

2   **Q. What are flotation costs?**

3   A. Flotation costs are the costs associated with the sale of new issues of common stock.  
4       These costs include out-of-pocket expenditures for preparation, filing, underwriting and  
5       other issuance costs of common stock.

6   **Q. Why is it important to recognize flotation costs in the allowed ROE?**

7   A. In order to attract and retain new investors, a regulated utility must have the opportunity  
8       to earn a return that is both competitive and compensatory. To the extent that a company  
9       is denied the opportunity to recover prudently incurred flotation costs, actual returns will  
10      fall short of expected (or required) returns, thereby diminishing its ability to attract  
11      adequate capital on reasonable terms.

12   **Q. Are flotation costs part of the utility's invested costs or part of the utility's**  
13    **expenses?**

14   A. Flotation costs are part of the invested costs of the utility, which are properly reflected on  
15      the balance sheet under "paid in capital." They are not current expenses, and therefore  
16      are not reflected on the income statement. Rather, like investments in rate base or the  
17      issuance costs of long-term debt, flotation costs are incurred over time. As a result, the  
18      great majority of a utility's flotation cost is incurred prior to the test year, but remains  
19      part of the cost structure that exists during the test year and beyond, and as such, should  
20      be recognized for ratemaking purposes. Therefore, recovery of flotation costs is  
21      appropriate even if no new issuances are planned in the near future because failure to

1 allow such cost recovery may deny the Company the opportunity to earn its required rate  
2 of return in the future.

3 **Q. Is the need to consider flotation costs eliminated because the Company is a wholly-**  
4 **owned subsidiary of Eversource Energy?**

5 A. No. Although the Company is a wholly owned subsidiary of Eversource Energy, it is  
6 appropriate to consider flotation costs because wholly owned subsidiaries receive equity  
7 capital from their parents and provide returns on the capital that roll up to the parent,  
8 which is designated to attract and raise capital based on the returns of those subsidiaries.  
9 To deny recovery of issuance costs associated with the capital that is invested in the  
10 subsidiaries ultimately would penalize the investors that fund the utility operations, and  
11 would inhibit the utility's ability to obtain new equity capital at a reasonable cost.

12 **Q. Do the DCF and CAPM models already incorporate investor expectations of a**  
13 **return in order to compensate for flotation costs?**

14 A. No. The models used to estimate the appropriate ROE assume no "friction" or  
15 transaction costs, as these costs are not reflected in the market price (in the case of the  
16 DCF model) or risk premium (in the case of the CAPM and the Bond Yield Plus Risk  
17 Premium model). Therefore, it is appropriate to consider flotation costs when  
18 determining where within the range of reasonable results the Company's return should  
19 fall.

20 **Q. Is the need to consider flotation costs recognized by the academic and financial**  
21 **communities?**

22 A. Yes. The need to reimburse investors for equity issuance costs is recognized by the

1 academic and financial communities in the same spirit that investors are reimbursed for  
2 the costs of issuing debt. This treatment is consistent with the philosophy of a fair rate of  
3 return. As explained by Dr. Shannon Pratt:

4 Flotation costs occur when a company issues new stock. The business  
5 usually incurs several kinds of flotation or transaction costs, which reduce  
6 the actual proceeds received by the business. Some of these are direct out-  
7 of-pocket outlays, such as fees paid to underwriters, legal expenses, and  
8 prospectus preparation costs. Because of this reduction in proceeds, the  
9 business's required returns must be greater to compensate for the  
10 additional costs. Flotation costs can be accounted for either by amortizing  
11 the cost, thus reducing the net cash flow to discount, or by incorporating  
12 the cost into the cost of equity capital. Since flotation costs typically are  
13 not applied to operating cash flow, they must be incorporated into the cost  
14 of equity capital.<sup>52</sup>

15 **Q. Have you calculated the effect of flotation costs on the return on equity?**

16 A. Yes, I have. I modified the DCF calculation to derive the dividend yield that would  
17 reimburse investors for direct issuance costs. Based on the weighted average issuance  
18 costs shown in Exhibit ES-RBH-11, a reasonable estimate of flotation costs is  
19 approximately 0.12 percent (12 basis points).

20 ***C. Other Considerations***

21 **Q. Are there other business risks that you have considered in developing your ROE**  
22 **recommendation?**

23 A. Yes, there are. First, one objective of the 2012 *Act relative to competitively priced*

---

<sup>52</sup> Shannon P. Pratt, Roger J. Grabowski, *Cost of Capital: Applications and Examples*, 4th ed. (John Wiley & Sons, Inc., 2010), page 586.

1        *electricity in the Commonwealth*<sup>53</sup> is to expand distributed generation and net metering  
2        opportunities, and to double the amount of power supply that electric distribution  
3        companies must purchase from renewable generators under long term contracts. That  
4        policy objective was reinforced in the Department's Order in the Electric Grid  
5        Modernization proceeding (D.P.U. 12-76-B). In its Order, the Department discussed  
6        distributed generation as one of the main objectives of the proceeding:

7                    Integrating distributed resources, such as renewables, EVs, microgrids,  
8                    and storage, is key to achieving the Commonwealth's climate and  
9                    resiliency goals and statutory requirements...Grid modernization will  
10                    enable the safe interconnection and full integration of greater quantities of  
11                    intermittent distributed resources.<sup>54</sup>

12        From the perspective of equity investors, distributed generation resources may lead to  
13        disruptions in the traditional cost recovery model for electric utilities and electricity  
14        markets and, therefore, introduce an incremental element of uncertainty and risk.  
15        Although it is difficult to quantify the effect, the additional risk associated with  
16        distributed generation within the Commonwealth of Massachusetts provides additional  
17        support for my ROE range and recommendation.

18        In addition, pursuant to the Green Communities Act, the Company has entered into a

---

<sup>53</sup> Chapter 209, Acts of 2012

<sup>54</sup> D.P.U. 12-76-B, *Investigation by the Department of Public Utilities on its own Motion into Modernization of the Electric Grid*, Order, June 12, 2014, at 12-13.

1 series of Commonwealth-mandated contracts relating to energy procurement.<sup>55</sup> Those  
2 contracts, which include commitments for wind and solar power, represent long-term  
3 financial obligations. Putting aside the question of the extent to which rating agencies  
4 will, or may, impute additional debt on the Company's balance sheet in connection with  
5 those agreements, the commitments are long-term fixed obligations that the Company is  
6 contractually bound to pay. As with other long-term contractual obligations, equity  
7 investors bear the residual risk if the Company is not able to recover its costs relating to  
8 those agreements; the additional financial leverage associated with the fixed obligations  
9 concentrates the residual equity risk. Consequently, potential changes in market  
10 conditions (that affect the market value of the contracts themselves) or the regulatory  
11 environment (enabling the Company to recover its costs) may represent an additional  
12 element of equity risk.

13 **Q. Do credit rating agencies recognize risks associated with an increase in distributed**  
14 **generation resources for a particular company?**

15 A. Yes, they do. Although S&P has noted that the competitive threat from rooftop solar  
16 panels has not been significant enough to have an effect on credit quality to date, it has  
17 outlined the potential risks to the electric utility sector:

18 ...should solar rooftop use suddenly increase, a utility would be forced to  
19 recover its excess electric capacity costs from its remaining customers.

---

<sup>55</sup> See e.g., *Petition of NSTAR Electric Company for approval by the Department of Public Utilities of: (1) a long-term contract to purchase wind power and renewable energy certificates, pursuant to St. 2008, c. 169, § 83, and 220 C.M.R. § 17.00 et seq.; and (2) a long-term renewable energy contract adjustment mechanism tariff, M.D.P.U. No. 164, D.P.U. 11-05/11-06/11-07, August 19, 2011.*

1           The resulting higher bills to the remaining utility customers would only  
2           further drive those customers to install solar panels. This could, again,  
3           prevent the utility from fully recovering its costs and investments in a  
4           timely manner, potentially harming its credit quality.<sup>56</sup>

5           Moody's has noted that under certain conditions, there could be "large negative  
6           consequences" for utilities as a result of the widespread deployment of distributed  
7           generation resources. Under those conditions, when the regulatory structure does not  
8           address the effect of distributed generation, Moody's suggests that "the likelihood of  
9           negative credit events would rise due to the technological disruption."<sup>57</sup>

10          Similarly, a July 2014 article quoted Bernstein Research analysts regarding the risk of  
11          distributed generation from a utility's perspective, stating that "[f]or the foreseeable  
12          future, distributed solar will exist in a parasitic relationship to the grid, absorbing its  
13          revenues while continuing to rely upon it for economic viability,' the analysts said,  
14          noting two specific challenges distributed solar creates for utilities: lost sales volume and  
15          a 'foregone' need for new capacity."<sup>58</sup>

---

<sup>56</sup> Standard and Poor's Research, "Why U.S. Electric Utilities' Credit Quality Can Withstand the Rise of Rooftop Solar," November 15, 2013, at 6.

<sup>57</sup> Moody's also refers to distributed generation as a "form of technology event risk, where event risk is low or remote, but with high severity implications should the event actually materialize." See Moody's Investors Service, *Regulatory framework holds keys to risk and rewards associated with distributed generation*, April 23, 2014, at 2.

<sup>58</sup> Copley, Michael, "Despite distributed generation's buzz, grid power 'here to stay,' Bernstein says," SNL Financial, July 21, 2014.

1 As to Massachusetts utilities in particular, a recent report identified the Commonwealth  
2 as among the first states in which electric industry disruption resulting from distributed  
3 generation is most likely to occur.<sup>59</sup>

4 **VIII. CAPITAL MARKET ENVIRONMENT**

5 **Q. Do economic conditions influence the required cost of capital and required return**  
6 **on common equity?**

7 A. Yes. As discussed in Section VI, the models used to estimate the Cost of Equity are  
8 meant to reflect, and therefore are influenced by, current and expected capital market  
9 conditions. Therefore, it is important to assess the reasonableness of any financial  
10 model's results in the context of observable market data. To the extent certain ROE  
11 estimates are incompatible with such data or inconsistent with basic financial principles,  
12 it is appropriate to consider whether alternative estimation techniques are likely to  
13 provide more meaningful and reliable results.

14 **Q. Do you have any general observations regarding the relationship between current**  
15 **capital market conditions and the Company's Cost of Equity?**

16 A. Yes, I do. Much has been reported about the Federal Reserve's market intervention since  
17 2007, and its effect on interest rates. Although the Federal Reserve completed its  
18 Quantitative Easing initiative in October 2014, it was not until December 2015 that it

---

<sup>59</sup> Deloitte Center for Energy Solutions, *The New Math: Solving the equation for disruption to the U.S. electric power industry*, 2014, at 4. See also Barclays Credit Research, *The Solar Vortex: Credit Implications of Electric Grid Defection*, May 20, 2014, at 4.

1 raised the Federal Funds rate, and began the process of rate normalization.<sup>60</sup> A  
2 significant issue, then, is how investors will react as that process continues, and  
3 eventually is completed. A viable outcome is that investors will perceive greater chances  
4 for economic growth, which will increase the growth rates included in the Constant  
5 Growth DCF model. At the same time, higher growth and the absence of Federal market  
6 intervention could provide the opportunity for interest rates to increase, thereby  
7 increasing the dividend yield portion of the DCF model. In that case, both terms of the  
8 Constant Growth DCF model would increase, producing increased ROE estimates.

9 More recently, interest rates have risen and credit spreads have become increasingly  
10 volatile. In the equity markets, sectors that historically have included dividend-paying  
11 companies have lost value, as increasing interest rates have provided investors with other  
12 sources of current yields. Because those dynamics affect different models in different  
13 ways, it would be inappropriate to rely on a single method to estimate the Companies'  
14 Cost of Equity. A more reasoned approach is to understand the relationships among  
15 Federal Reserve policies, interest rates, and measures of market risk, and to assess how  
16 those factors may affect different models and their results. As discussed throughout my  
17 Direct Testimony, the current market is one in which it is very important to consider a  
18 broad range of data and models when determining the Cost of Equity.

---

<sup>60</sup> Federal Reserve Press Release dated December 16, 2015.

1 **Q. Please summarize the effect of recent Federal Reserve policies on interest rates and**  
2 **the Cost of Capital.**

3 A. Beginning in 2008, the Federal Reserve proceeded on a steady path of initiatives intended  
4 to lower long-term Treasury yields.<sup>61</sup> The Federal Reserve policy actions “were designed  
5 to put downward pressure on longer-term interest rates by having the Federal Reserve  
6 take onto its balance sheet some of the duration and prepayment risks that would  
7 otherwise have been borne by private investors.”<sup>62</sup> Under that policy, “Securities Held  
8 Outright” on the Federal Reserve’s balance sheet increased from approximately \$489  
9 billion at the beginning of October 2008 to approximately \$4.23 trillion by the end of  
10 November 2016.<sup>63</sup> To put that increase in context, the securities held by the Federal  
11 Reserve represented approximately 3.29 percent of GDP at the end of September 2008,  
12 and had risen to approximately 22.65 percent of GDP in November 2016.<sup>64</sup> As such, the  
13 Federal Reserve policy actions have represented a significant source of liquidity, and  
14 have had a substantial effect on capital markets.

15 Just as market intervention by the Federal Reserve has reduced interest rates, it also had  
16 the effect of reducing market volatility. As shown in Chart 3 (below), each time the  
17 Federal Reserve began to purchase bonds (as evidenced by the increase in “Securities  
18 Held Outright” on its balance sheet), volatility subsequently declined. In fact, in

---

<sup>61</sup> See Federal Reserve Press Release (June 19, 2013).

<sup>62</sup> Federal Reserve Bank of New York, Domestic Open Market Operations During 2012, p. 29 (Apr. 2013).

<sup>63</sup> Source: Federal Reserve Board Schedule H.4.1. “Securities held outright” include U.S. Treasury securities, Federal agency debt securities, and mortgage-backed securities.

<sup>64</sup> Source: Federal Reserve Board Schedule H.4.1; Bureau of Economic Analysis.

1       September 2012, when the Federal Reserve began to purchase long-term securities at a  
2       pace of \$85 billion per month, volatility (as measured by the CBOE Volatility Index,  
3       known as the “VIX”) fell, and through October 2014 remained in a relatively narrow  
4       range. The reason is quite straight-forward: Investors became confident that the Federal  
5       Reserve would intervene if markets were to become unstable.

6       **Chart 3: VIX and Federal Reserve Asset Purchases<sup>65</sup>**

7       The important analytical issue is whether we can infer that risk aversion among investors  
8       is at a historically low level, implying a Cost of Equity that is well below recently  
9       authorized returns. Given the negative correlation between the expansion of the Federal  
10       Reserve’s balance sheet and the VIX, it is difficult to conclude that fundamental risk  
11       aversion and investor return requirements have fallen. If it were the case that investors

<sup>15</sup> Source: Federal Reserve Economic Data (FRED), Federal Reserve Bank of St. Louis; Federal Reserve Statistical Release H.4.1, Factors Affecting Reserve Balances.

1 believe that volatility will remain at low levels (that is, that market risk and uncertainty  
2 will remain low), it is not clear why they would decrease their return requirements for  
3 defensive sectors such as utilities. In that respect, it appears that the Constant Growth  
4 DCF results are at odds with market conditions.

5 **Q. Does your recommendation also consider the interest rate environment?**

6 **A.** Yes, it does. From an analytical perspective, it is important that the inputs and  
7 assumptions used to arrive at an ROE recommendation, including assessments of capital  
8 market conditions, are consistent with the recommendation itself. Although I appreciate  
9 that all analyses require an element of judgment, the application of that judgment must be  
10 made in the context of the quantitative and qualitative information available to the analyst  
11 and the capital market environment in which the analyses were undertaken.

12 The low interest rate environment associated with central bank intervention may lead  
13 some analysts to conclude that current capital costs, including the Cost of Equity, are low  
14 and will remain as such. Putting aside the increases in volatility discussed above, that  
15 conclusion only holds true under the hypothesis of Perfectly Competitive Capital Markets  
16 (“PCCM”) and the classical valuation framework which, under normal economic and  
17 capital market conditions, underpin the traditional Cost of Equity models. PCCMs are  
18 those in which no single trader, or “market-mover”, would have the power to change the

1 prices of goods or services, including bond and common stock securities.<sup>66</sup> In other  
2 words, under the PCCM hypothesis, no single trader would have a significant effect on  
3 market prices.

4 Classic valuation theory assumes that investors trade securities rationally, with prices  
5 reflecting their perceptions of value.<sup>67</sup> Although central banks have the ability to set  
6 benchmark interest rates, they have been maintaining below normal rates to stimulate  
7 continued economic and capital market recovery. It therefore is reasonable to conclude  
8 that the Federal Reserve and other central banks have been acting as market-movers,  
9 thereby having a significant effect on the market prices of both bonds and stocks. The  
10 presence of market-movers, such as the Federal Reserve, runs counter to the PCCM  
11 hypothesis, which underlies traditional Cost of Equity models. Consequently, the results  
12 of those models should be considered in the context of both quantitative and qualitative  
13 information.

14 Although the Federal Reserve's market intervention policies have kept interest rates  
15 historically low, since July 8, 2016 (when the 30-year Treasury yield hit an all-time low  
16 of 2.11 percent), the 30-year Treasury yield has risen approximately 100 basis points.

17 **Q. Have credit spreads changed recently?**

18 **A.** Yes, they have. Because credit spreads, which represent the difference between the

---

<sup>66</sup> See Myron J. Gordon, *The Cost of Capital to a Public Utility*, 1974, at 15. See also <http://www.nasdaq.com/investing/glossary/p/perfectly-competitive-financial-markets>.

<sup>67</sup> *I.e.*, the traditional efficient markets formulation. See Stowe et al., *Equity Asset Valuation*, 2007, at 18.

1 yields on debt and Treasury yields, can be directly observed, we can review the change in  
2 spreads over time and relative to other market sectors. Although credit spreads are not a  
3 full measure of equity risk, they reasonably can be seen to reflect, to some extent,  
4 investors' assessment of risk at a given point in time. As Chart 4 below indicates, current  
5 credit spreads (for A-rated utilities) are near their highest level since the year 2006, but  
6 for the financial crisis during 2008 and 2009.

7 **Chart 4: A-Rated Utility Credit Spreads<sup>68</sup>**

8  
9 Looking to the period subsequent to the financial crisis, the 100-day average credit spread  
10 is in the top 79th percentile. Taken from that perspective, it is apparent that investors  
11 currently see the utility sector as relatively risky, and require higher returns as  
12 compensation for that risk.

<sup>68</sup> Source: Bloomberg Professional. 100-day moving average.

1 As to the relationship between the level of Treasury yields and credit spreads, the level of  
2 explanatory value is essentially zero; Treasury yields explain virtually none of the change  
3 in credit spreads. Equity market volatility (as measured by the VIX), on the other hand,  
4 explains about 68.00 percent of the change in credit spreads. That is, investors are  
5 concerned with market uncertainty, and require higher returns as uncertainty increases.  
6 Based on data from the Chicago Board Options Exchange, broad market volatility is  
7 expected to increase by over 75.00 percent over the coming two years.<sup>69</sup>

8 **Q. Have you also reviewed the relationship between credit spreads for A-rated utility**  
9 **debt relative to A-rated corporate debt?**

10 **A.** Yes, I have. Given the historical volatility in the spread between corporate and utility A-  
11 rated debt, there is no reason to conclude that utility yields are different than those of  
12 their corporate counterparts. That conclusion is consistent with the finding that over  
13 time, there has been a nearly one-to-one relationship between credit spreads on A-rated  
14 corporate and utility bonds. In fact, a regression analysis in which corporate credit  
15 spreads are the explanatory variable and utility credit spreads are the dependent variable  
16 shows that slope is approximately 1.00 and highly significant (see Chart 5, below).  
17 Because the intercept term is statistically insignificant, we can conclude that there has  
18 been no material difference between the two, and there certainly is no meaningful  
19 difference in the current market.

---

<sup>69</sup> Source: CBOE.com, accessed December 9, 2016.

1 **Chart 5: Corporate and Utility Credit Spreads (A-Rated)**<sup>70</sup>

2 **Q. Are interest rates expected to increase going forward?**

3 **A.** Yes, they are. At its December meeting, the Federal Reserve's Federal Open Market  
4 Committee raised the target federal funds rate for the second time since ending its  
5 Quantitative Easing program in 2014 to 0.50 percent – 0.75 percent.<sup>71</sup> In its post-meeting  
6 press release, Federal Reserve Chair Janet Yellen stated that the median projection for the  
7 federal funds rate rises from the current 0.75 percent to 1.40 percent at the end of 2017,  
8 2.10 percent at the end of 2018, and 2.90 percent by the end of 2019.<sup>72</sup>

<sup>70</sup> Source: Bloomberg Professional. Please note that for a univariate regression, the correlation coefficient equals the square root of the R-square. In this case, the square root of 0.966 is approximately 0.983 (98.30 percent).

<sup>71</sup> FOMC Press Conference, December 14, 2016, at 1.

<sup>72</sup> <https://www.federalreserve.gov/mediacenter/files/FOMCpresconf20161214.pdf>

*Ibid.*, at 3.

1 **Q. Does market-based data indicate that investors see a probability of increasing**  
2 **interest rates?**

3 A. Yes. There is observable market data indicating investors expect interest rates to increase  
4 in the near future. Regarding future Federal Funds rate increases, data compiled by CME  
5 Groups indicates that investors see a 97.00 percent likelihood of further Federal Funds  
6 rate increases, even after the December 14, 2016 increase. As shown in Table 9, (below)  
7 the market is now anticipating at least one additional rate hike (74.30 percent probability)  
8 and possibly two or three (33.60 percent and 8.80 percent probability, respectively) by  
9 December 2017.

10 **Table 9: Probability of Federal Funds Rate Increases<sup>73</sup>**

Target Rate (bps)	Federal Reserve Meeting Date							
	2/1/17	3/15/17	5/3/17	6/14/17	7/26/17	9/20/17	11/1/17	12/13/17
50-75	96.0%	79.0%	63.8%	25.5%	19.8%	10.1%	8.5%	3.5%
75-100	4.0%	20.3%	31.6%	50.9%	45.2%	32.8%	29.1%	17.5%
100-125		0.7%	4.5%	20.7%	27.5%	36.2%	35.7%	32.7%
125-150			0.1%	2.7%	6.8%	16.9%	20.0%	28.8%
150-175				0.1%	0.7%	3.7%	5.8%	13.4%
175-200						0.3%	0.9%	3.5%
200-225							0.1%	0.5%

11  
12 In fact, the probability of no increase in the coming year is only 3.50 percent.  
13 Looking to long-term interest rates, consensus projections gathered by Blue Chip  
14 Financial Forecasts suggest a 30-year Treasury yield of 3.40 percent by the first quarter

<sup>73</sup> Source: <http://www.cmegroup.com/trading/interest-rates/countdown-to-fomc.html>, accessed 12/15/2016.

1 of 2018 (an approximately 38 basis point increase over the 3.02 percent yield as of end of  
2 November, and 25 basis points above the December 15 spot yield).<sup>74</sup> The Social Security  
3 Administration (“SSA”) projects that long-term Treasury yields will rise from 2.40  
4 percent in 2016 to 4.80 percent by 2021. Similarly, market expectations for increased  
5 long-term Treasury yields are apparent in the market prices to buy or sell at-the-money  
6 options in long-term Government bond funds. That is, the value of the option to sell the  
7 TLT (an exchange-traded fund of long-term Government bonds) in January 2019 at  
8 today’s price is approximately one and a half times more than the value of the option to  
9 buy that fund.<sup>75</sup> Since bond prices fall as interest rates increase, investors see a greater  
10 likelihood of increases in long-term interest rates than decreases.

11 Lastly, we can view the market’s expectations of future interest rates based on the current  
12 yield curve. Those expected rates, often referred to as “forward yields” are derived from  
13 the “Expectations” theory, which states that (for example) the current 30-year Treasury  
14 yield equals the combination of the current three-year Treasury yield, and the 29-year  
15 Treasury yield expected in one year. That is, an investor would be indifferent to (1)  
16 holding a 30-year Treasury to maturity, or (2) holding a one-year Treasury to maturity,

---

<sup>74</sup> Blue Chip Financial Forecasts, Vol. 35, No. 12, December 1, 2016, at 2.  
<sup>75</sup> <http://www.nasdaq.com/symbol/tlt/option-chain?dateindex=8>

1 then a 29-year Treasury bond, also to maturity.<sup>76</sup> As Chart 6 (below) indicates, since  
2 2006 the implied forward 29- and 28- year yields (one and two years hence, respectively)  
3 consistently exceeded the (interpolated) spot yields. That is, just as economists'  
4 projections implied increased interest rates, so did observable Treasury yields.

5 **Chart 6: Forward vs. Interpolated Treasury Yields<sup>77</sup>**

6  
7 **Q. Have you considered other data points in your assessment of general economic**  
8 **conditions?**

9 **A. Yes.** Although a single observation, I note that the Bureau of Economic Analysis

<sup>76</sup> In addition to the Expectations theory, there are other theories regarding the term structure of interest rates including: the Liquidity Premium Theory, which asserts that investors require a premium for holding long term bonds; the Market Segmentation Theory, which states that securities of different terms are not substitutable and, as such, the supply of and demand for short-term and long-term instruments is developed independently; and the Preferred Habitat Theory, which states that in addition to interest rate expectations, certain investors have distinct investment horizons and will require a return premium for bonds with maturities outside of that preference.

<sup>77</sup> Source: Federal Reserve Schedule H.15. Spot yields are interpolated.

1 recently announced that third quarter Gross Domestic Product rose by 3.50 percent.<sup>78</sup> At  
2 the same time, expected inflation (as measured by the 30-year TIPS spread) was in the  
3 range of 2.05 percent to 2.10 percent,<sup>79</sup> suggesting nominal GDP growth in the range of  
4 5.60 percent to 5.65 percent, which is above, yet comparable to the 5.36 percent long-  
5 term growth rate I use in my Multi-Stage DCF analysis.

6 **Q: What do you conclude from those analyses?**

7 A: First, it is clear that interest rates have increased from the low levels experienced in early  
8 2016. It also is clear that investor expectations, as measured by forward Treasury yields  
9 and the implied probability of Federal Funds rate increases, suggest rising capital costs in  
10 the near term. Those higher Treasury yields, combined with elevated credit spreads again  
11 indicate expectations for increased capital costs. The observation that interest rates and  
12 GDP growth have increased indicate that the financial community sees the strong  
13 prospect of increased growth throughout the economy. As that occurs, and as interest  
14 rates continue to rise, it would be reasonable to expect higher dividend yields and higher  
15 growth rates. In the context of the Discounted Cash Flow model, those variables would  
16 combine to indicate increases in the Cost of Equity.

17 Although the market data discussed above indicate increasing costs of capital, it is  
18 important to keep in mind that estimating the Cost of Equity is an empirical, but not an  
19 entirely mathematical exercise; that the methods used, or the weight given to any one

---

<sup>78</sup> Bureau of Economic Analysis, News Release dated December 22, 2016.

<sup>79</sup> Federal Reserve Schedule H.15, dated December 27, 2016.

1 method, may change from case to case; and that the returns authorized in other  
2 jurisdictions provide a relevant, observable, and verifiable benchmark for assessing the  
3 reasonableness of analytical assumptions, results, and conclusions.

4 **Q. Have there been other recent periods when utility valuation levels were high relative**  
5 **to both their long-term average and the market?**

6 **A.** Yes. In early 2015, the utility sector (as measured by the S&P Electric Utility Index)  
7 traded at a Price/Earnings ratio of approximately 18.00. During the same period, the  
8 overall market (as measured by the S&P 500) traded at a P/E of approximately 18.00. In  
9 late January 2015, the utility sector began to lose value, and by June 2015 it had lost  
10 approximately 15.50 percent of its value. Similarly, the P/E ratio of the S&P Electric  
11 Utility Index was only slightly below that of the S&P 500 in early July 2016. Since then,  
12 the S&P Electric Utility Index lost approximately 13.00 percent of its value, while the  
13 S&P 500 increased approximately 3.64 percent. Also during that time, the 30-year  
14 Treasury yield increased by almost 90 basis points (an increase of over 40.00 percent).  
15 The point simply is that as investors see an increasing likelihood of higher interest rates,  
16 they will move out of sectors that provided higher yields relative to the overall market.  
17 As they do, valuations and P/E ratios fall.

18 **Q. What conclusions do you draw from your analyses of the current capital market**  
19 **environment, and how do those conclusions affect your ROE recommendation?**

20 **A.** In my view, we cannot conclude that the recent levels of utility valuations are due to a  
21 fundamental change in the risk perceptions of utility investors. Utility credit spreads are  
22 at historically elevated levels, and there is no measurable difference between credit

1 spreads of A-rated utility debt, and A-rated corporate debt. That is, based on analyses of  
2 credit spreads, there is no reason to conclude that investors see utilities as less risky  
3 relative to either historical levels or to their corporate counterparts.

4 From an analytical perspective, it is important that the inputs and assumptions used to  
5 arrive at an ROE determination, including assessments of capital market conditions, are  
6 consistent with the conclusion itself. Although I appreciate that all analyses require an  
7 element of judgment, the application of that judgment must be made in the context of the  
8 quantitative and qualitative information available to the analyst and the capital market  
9 environment in which the analyses were undertaken. Because the application of financial  
10 models and interpretation of their results often is the subject of differences among  
11 analysts in regulatory proceedings, I believe that it is important to review and consider a  
12 variety of data points; doing so enables us to put in context both quantitative analyses and  
13 the associated recommendations.

14 Because not all models used to estimate the Cost of Equity adequately reflect those  
15 changing market dynamics, it is important to give appropriate weight to the methods and  
16 to their results. Moreover, because those models produce a range of results, it is  
17 important to consider the type of data discussed above in determining where the  
18 Companies' ROE falls within that range. On balance, I believe that Constant Growth  
19 DCF-based results should be viewed very carefully, and that somewhat more weight  
20 should be afforded the Risk Premium-based methods. I believe that doing so supports  
21 my recommended range of 10.00 percent to 10.75 percent, and my ROE recommendation

1 of 10.50 percent.

2 **IX. CAPITAL STRUCTURE**

3 **Q. What is the Company's proposed capital structure for NSTAR Electric and**  
4 **WMECO?**

5 A. The Company has proposed a capital structure composed of 53.37 percent common  
6 equity, 0.94 percent preferred stock, and 45.69 percent long-term debt for NSTAR  
7 Electric; and a capital structure composed of 53.34 percent common equity and 46.66  
8 percent long-term debt for WMECO.

9 **Q. How does the capital structure affect the Cost of Equity?**

10 A. The capital structure relates to a company's financial risk, which represents the risk that a  
11 company may not have adequate cash flows to meet its financial obligations, and is a  
12 function of the percentage of debt (or financial leverage) in its capital structure. In that  
13 regard, as the percentage of debt in the capital structure increases, so do the fixed  
14 obligations for the repayment of that debt. Consequently, as the degree of financial  
15 leverage increases, the risk of financial distress (*i.e.*, financial risk) also increases.  
16 Because the capital structure can affect the subject company's overall level of risk, it is  
17 an important consideration in establishing a just and reasonable rate of return.

18 **Q. Please discuss your analysis of the capital structures of the proxy group companies.**

19 A. The proxy group has been selected to reflect comparable companies in terms of financial,  
20 business, and regulatory risks. Therefore, it is appropriate to compare the capital  
21 structures of the utility operating companies held by the proxy group companies to that of

1 the subject company in order to assess whether the proposed capital structure is  
2 consistent with industry standards for companies with commensurate risk profiles. As a  
3 measure of industry practice, I calculated the average capital structure for each of the  
4 utility operating companies held by the proxy companies over the last eight fiscal  
5 quarters. As shown in Exhibit ES-RBH-9, the Company's proposed equity ratios of  
6 53.37 percent for NSTAR Electric and 53.34 percent for WMECO are within the range of  
7 equity ratios for that group, and are comparable to the median equity ratio of  
8 approximately 52.11 percent. The average common equity ratios (on a company-specific  
9 basis) range from 33.69 percent to 58.48 percent. Similarly, although some of the proxy  
10 companies employ slightly lower amounts of preferred equity and slightly more long-  
11 term debt than the Company proposes, the proposed long-term debt ratio of 45.69 percent  
12 for NSTAR Electric and 46.66 percent for WMECO are well within the range of ratios  
13 for the proxy group. Finally, the proposed preferred equity ratio of 0.94 percent for  
14 NSTAR Electric is also within the range of preferred equity ratios for the proxy group. It  
15 is my view, therefore, that the Company's proposed capital structures are consistent with  
16 its peers and are reasonable for the purpose of determining its overall rate of return.

17 **Q. Is the Company's proposed equity ratios consistent with "sound utility practice"?**

18 A. Yes, they are. First, as discussed above, the Company's proposed common equity ratios  
19 are within the range of the capital structures in place at the proxy group companies used to  
20 estimate its cost of equity. Moreover, the proposed capital structures will be in line with  
21 the U.S. utility industry generally, and with other regulated utilities in Massachusetts. A

1 November 2016 report by Regulatory Research Associates (“RRA”) reported that the  
2 average common equity ratio (excluding short-term debt) for the 81 major utility  
3 subsidiaries of the RRA Index companies as of September 30, 2016, was 52.40 percent.  
4 SNL Energy reports that this average equity ratio has been quite stable, with the average  
5 year-end equity ratio (excluding short-term debt) ranging from 51.31 percent to 52.49  
6 percent for 2012 through 2015.<sup>80</sup> Among Massachusetts electric and natural gas  
7 distribution utilities, currently authorized equity ratios range from approximately 50.00  
8 percent to 53.54 percent. Consequently, I believe the Company’s proposed capital  
9 structure of 53.37 percent common equity, 0.94 percent preferred stock, and 45.69 percent  
10 long-term debt for NSTAR Electric, and 53.34 percent common equity and 46.66 percent  
11 long-term debt for WMECO, is appropriate.

12 **Q. What is your conclusion regarding an appropriate capital structure for the NSTAR**  
13 **Electric and WMECO?**

14 A. Considering the median actual equity ratio of 52.11 percent for the proxy group  
15 companies, I believe that the Company’s proposed common equity ratios of 53.37 percent  
16 for NSTAR Electric and 53.34 percent for WMECO is appropriate as it is consistent with  
17 the proxy group companies.

<sup>80</sup> SNL Energy Financial Focus, “Quality Measures: Utility Subsidiaries, Calendar Years 2012-2015, and 12 Months Ended September 30, 2016,” November 29, 2016, at 6.

1 **X. SUMMARY AND CONCLUSIONS**

2 **Q. What is your conclusion regarding the Company's Cost of Equity?**

3 A. I believe that a return on common equity in the range of 10.00 percent to 10.75 percent  
4 represents the range of equity investors' required return for investment in electric utilities  
5 similar to the Company in today's capital markets. Within that range, I believe that 10.50  
6 percent is reasonable and appropriate.

7 My recommendation considers the Company's risk profile relative to the proxy group,  
8 including the Company's rate mechanisms relative to its peers, flotation costs, the effect  
9 of the proposed ROE on the Company's financial integrity, and the increasing presence  
10 of DG and long-term contracts. As discussed throughout my Direct Testimony, an ROE  
11 of 10.50 percent reasonably represents the return required to invest in a company with a  
12 risk profile comparable to the Company, assuming the Company has a reasonable  
13 opportunity to earn that return. Table 11 summarizes my analytical results.
