

Our Commitment to Biodiversity

In addition to carrying electricity to homes and businesses across the region, our power line corridors are also essential to animal movement, providing areas of low growth habitat and serving as travel pathways. Hundreds of species of plants, insects, amphibians, reptiles, fungi, birds and mammals make their home within this critical low growth environment, and we're committed to being a good neighbor through environmental stewardship as we deliver reliable power to our customers.

an amphibian or reptile

Power Line Corridors Create and Sustain Habitats

Did you know that native plants, pollinators, and hundreds of wildlife species—including the 20 **herptiles** featured in this guide—thrive in the diverse habitat we create by maintaining our power line corridors? While trees are a treasured part of the landscape here in New England, they're also the number one cause of power outages for our customers during storms. Balancing our customers' need for safe and reliable power with the benefits trees provide, our vegetation management programs create critical low growth habitat that many creatures who call our power line corridors home depend on.

Protecting Habitat and Wildlife

Artist Bio
Matt Patterson

From as far back as he remembers, **Matt Patterson** has loved both wildlife and art. He grew up in a small, rural New Hampshire town. In his free time, he was either out fishing, searching for turtles and snakes, or painting. There's almost no distance Matt won't go, almost nothing he won't do, to learn all he can about his subjects to make his paintings of wildlife as accurate and lifelike as possible.

Matt is a member of Artists for Conservation and is a Fellow in The Explorers Club. His work has been featured in Yankee Magazine, Fine Art Connoisseur and has won numerous awards, including twice winning the Roger Tory Peterson Wild American Art award. Matt has illustrated several books, including two written by bestselling author Sy Montgomery: The New York Times national bestseller *Of Time and Turtles* and *The Book of Turtles*, which won seven national awards. Matt received a degree in Illustration from the Art Institute of Boston.

Snapping Turtle
(*Chelydra serpentina*)

20 Herptiles in Eversource's Power Line Corridors

American Toad (<i>Anaxyrus americanus</i>) Amphibian, 2–4.5 inches in length	Diamond-Backed Terrapin (<i>Malaclemys terrapin</i>) Reptile, 4–9 inches in length	Fowler's Toad (<i>Anaxyrus fowleri</i>) Amphibian, 2.5–3.75 inches in length	Spadefoot Toad (<i>Scaphiopus holbrookii</i>) Amphibian, 1.75–2.25 inches in length
This toad can often be found on the forest floor eating insects, spiders, earthworms, slugs and other invertebrates. Heard in spring and summer, its high-pitched musical trill can last up to 30 seconds.	With a lifespan of 25–40 years, this coastal species inhabits salt marshes, estuaries and tidal creeks. It eats snails, small crustaceans, worms and some aquatic plants, and excretes excess salt from its diet through special eye glands.	Named for S.P. Fowler, a Massachusetts naturalist who identified it in 1858, this mostly nocturnal toad stays undercover in daylight hours and prefers sandy areas near wetlands. Its “wahhh” call resembles a bleating sheep.	Named for the hard-digging structures on its hind feet, the Spadefoot spends most of its time underground and hunts for small prey at night. Its breeding call of “caaw...caaw” resembles a young crow.
Black Racer (<i>Crotalus constrictor</i>) Reptile, 33–65 inches in length	Eastern Box Turtle (<i>Terrapene carolina</i>) Reptile, 4.5–6.6 inches in length	Jefferson Salamander (<i>Ambystoma jeffersonianum</i>) Amphibian, 4–7 inches in length	Spotted Salamander (<i>Ambystoma maculatum</i>) Amphibian, 6–9 inches in length
This swift, non-venomous snake moves at a top speed of about eight to 10 miles per hour. It prefers lightly wooded, open habitats, such as meadows, fields and areas between forests and fields.	This turtle is named for its ability to enclose its head, legs and tail within a hinged plastron—a shell underneath its carapace (top shell). It builds a dome-like structure in the afternoon where it spends the night.	Named after Jefferson College in Pennsylvania, this long-toed mole salamander lives underground or hidden under rocks, logs or leaf litter for most of its life. It emerges in spring, migrating to its breeding pool.	Although it has large yellow spots, this mole salamander can be hard to find. It likes hidden environments in forested areas close to vernal pools, wetlands or ponds and can live for more than 20 years.
Blanding's Turtle (<i>Emydoidea blandingii</i>) Reptile, 6–9 inches in length	Blue-Spotted Salamander (<i>Ambystoma laterale</i>) Amphibian, 3–5 inches in length	Eastern Hognose Snake (<i>Heterodon platirhinos</i>) Reptile, 20–40 inches in length	Marbled Salamander (<i>Ambystoma opacum</i>) Amphibian, 3–5 inches in length
Living in a variety of habitats, this turtle eats while on land and in water. As an omnivore, it eats both plants (such as duckweed, bulrush and sedge) and animals (such as snails, crayfish and earthworms).	Living in a variety of habitats, this turtle eats while on land and in water. As an omnivore, it eats both plants (such as duckweed, bulrush and sedge) and animals (such as snails, crayfish and earthworms).	This snake gets its name from its turned-up nose and is sometimes called a puff adder. When threatened, it raises its head, flattens its neck, inflates its body (looking like a cobra) and hisses loudly before playing dead. Its favorite food is toads.	This mole salamander has a marbled pattern that extends from head to tail. It prefers dry, sandy-soiled habitats in forests and woodlands with water close by and breeds in varied wetlands.
Bog Turtle (<i>Glyptemys muhlenbergii</i>) Reptile, 3–4 inches in length	Blue-Spotted Salamander (<i>Ambystoma laterale</i>) Amphibian, 3–5 inches in length	Eastern Milk Snake (<i>Lampropeltis triangulum</i>) Reptile, 19–40 inches in length	Red Eft (<i>Notophthalmus viridescens viridescens</i>) Amphibian, about 3 inches in length
As its name implies, this turtle lives in bogs and other wetlands and eats seeds, berries, insects, worms, crayfish, snails and frogs. It likes sunny, open areas where it can rest and raise its body temperature.	With its variable pattern of sky-blue spots, blotches and flecks, this mole salamander inhabits forests and woodlands with sandy to loamy soils. Its diet includes insects, slugs, earthworms, spiders, snails and centipedes.	The frequent appearance of this non-venomous snake in barns led to the inaccurate belief that it sucks milk from cows, leading to the name Milk Snake. It spends most of its time hidden and is active mostly at night.	Beginning life as an egg then an aquatic creature, the Red-Spotted Newt transitions to land and enters the juvenile “Red Eft” bright orange stage before returning to water as a yellow and green adult.
Bog Turtle (<i>Glyptemys muhlenbergii</i>) Reptile, 3–4 inches in length	Five-Lined Skink (<i>Plestiodon fasciatus</i>) Reptile, 5–8.5 inches in length	Eastern Milk Snake (<i>Lampropeltis triangulum</i>) Reptile, 19–40 inches in length	Red Eft (<i>Notophthalmus viridescens viridescens</i>) Amphibian, about 3 inches in length
With a neck that can stretch the length of its shell, this turtle can be found in water bodies, including rivers, lakes and marshes. Its diet includes different plants and animals, but it becomes more vegetarian as it ages.	The yellowish stripes on the Five-Lined Skink’s body become less noticeable as it ages. New England’s only lizard, it likes steep, rocky areas with open ledge and forages for insects (crickets, flies, grasshoppers, grubs, beetles, ants) and spiders.	The frequent appearance of this non-venomous snake in barns led to the inaccurate belief that it sucks milk from cows, leading to the name Milk Snake. It spends most of its time hidden and is active mostly at night.	This venomous snake prefers rocky, forested hillsides and feeds mostly on mice, other small mammals, and sometimes birds. While some snake species lay eggs, others, like the Timber Rattlesnake, hatch eggs internally, resulting in a live birth.
Bog Turtle (<i>Glyptemys muhlenbergii</i>) Reptile, 3–4 inches in length	Five-Lined Skink (<i>Plestiodon fasciatus</i>) Reptile, 5–8.5 inches in length	Eastern Milk Snake (<i>Lampropeltis triangulum</i>) Reptile, 19–40 inches in length	Timber Rattlesnake (<i>Crotalus horridus</i>) Reptile, 36–60 inches in length
As its name implies, this turtle lives in bogs and other wetlands and eats seeds, berries, insects, worms, crayfish, snails and frogs. It likes sunny, open areas where it can rest and raise its body temperature.	With a neck that can stretch the length of its shell, this turtle can be found in water bodies, including rivers, lakes and marshes.
